

## LIMITED WARRANTY

Radio Shack warrants for a period of 90 days from the date of delivery to customer that the computer hardware described herein shall be free from defects in material and workmanship under normal use and service. This warranty shall be void if the computer case or cabinet is opened or if the unit is altered or modified. During this period, if a defect should occur, the product must be returned to a Radio Shack store or dealer for repair. Customer's sole and exclusive remedy in the event of defect is expressly limited to the correction of the defect by adjustment, repair or replacement at Radio Shack's election and sole expense, except there shall be no obligation to replace or repair items which by their nature are expendable. No representation or other affirmation of fact, including but not limited to statements regarding capacity, suitability for use, or performance of the equipment, shall be or be deemed to be a warranty or representation by Radio Shack, for any purpose, nor give rise to any liability or obligation of Radio Shack whatsoever.

**EXCEPT AS SPECIFICALLY PROVIDED IN THIS AGREEMENT, THERE ARE NO OTHER WARRANTIES, EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE AND IN NO EVENT SHALL RADIO SHACK BE LIABLE FOR LOSS OF PROFITS OR BENEFITS, INDIRECT, SPECIAL, CONSEQUENTIAL OR OTHER SIMILAR DAMAGES ARISING OUT OF ANY BREACH OF THIS WARRANTY OR OTHERWISE.**

### IMPORTANT NOTICE

**ALL RADIO SHACK COMPUTER PROGRAMS ARE DISTRIBUTED ON AN "AS IS" BASIS WITHOUT WARRANTY**

Radio Shack shall have no liability or responsibility to customer or any other person or entity with respect to any liability, loss or damage caused or alleged to be caused directly or indirectly by computer equipment or programs sold by Radio Shack, including but not limited to any interruption of service, loss of business or anticipatory profits or consequential damages resulting from the use or operation of such computer or computer programs.

**NOTE:** Good data processing procedure dictates that the user test the program, run and test sample sets of data, and run the system in parallel with the system previously in use for a period of time adequate to insure that results of operation of the computer or program are satisfactory.

## **This Reference Manual and You**

We've prepared this Reference Manual with the assumption that you — the user — already have considerable experience with programming in BASIC. Our LEVEL I User's Manual was written for the total beginner — and has been greeted with wide acclaim. We freely admit this Manual has not been written from the same perspective.

But by the time you recognize a desire (or need) for a LEVEL II BASIC, we expect that you've gone through our LEVEL I Manual and have a solid foundation in programming.

If this is your first experience with programming micro-computers, we very strongly urge you to spend time with a LEVEL I TRS-80 first — and the Manual we prepared for it.

If you've had experience with other forms of the BASIC language (other micro-computers or time share systems) then you should be ready for our Reference Manual for LEVEL II.

LEVEL II is a far more powerful version of BASIC than was LEVEL I. If you have been working with LEVEL I for some time, be prepared for some pleasant surprises — and some differences that might throw you for awhile (for example, LEVEL I programs won't run as-is on a LEVEL II machine... you'll have to modify them). This Manual is a complete reference guide — it is not intended to be a complete step-by-step training manual or an applications book (that will come later).

If you have some suggestions... criticisms... additions... concerning this Manual — we'd be glad to hear from you.

# Setting Up The System

Carefully unpack the system. Remove all packing material. Be sure you locate all cables, papers, tapes, etc. Save the packing material in case you need to transport the system.

## Connecting the Video Display and Keyboard:

1. Connect the power cord from the Video Display to a source of 120 volts, 60 Hz AC power. Note that one prong of the AC plug is wider than the other — the wide prong should go into the widest slot of the AC socket.  
NOTE: If you use an AC extension cord, you may not be able to plug the Display's power cord in. Do not attempt to force this wide prong into the extension cord; use a wall outlet if at all possible.
2. Connect the power cord of the Power Supply to a source of 120 volts, 60 Hz AC power.
3. Connect the gray cable from the front of the Video Monitor to the VIDEO jack on the back of the Keyboard Assembly. Take care to line up the pins correctly (the plug fits only one way).  
NOTE: Before the next step, be sure the POWER switch on the back of the Keyboard is off (button out).
4. Connect the gray cable from the Power Supply to the POWER jack on the back of the Keyboard Assembly. Again, take care to mate the connection correctly.

## Connecting The Cassette Recorder:

NOTE: You do not need to connect the Cassette Recorder unless you plan to record programs or to load taped programs into the TRS-80.

1. Connect the CTR-41 to a source of 120 volt AC power. (Batteries are not recommended for using Recorder with TRS-80.)
2. Connect the short cable (DIN plug on one end and 3 plugs on the other) to the TAPE jack on the back of the Keyboard Assembly. Be sure you get the plug to mate correctly.
3. The 3 plugs on the other end of this cable are for connecting to the CTR-41.

---

- A. Connect the black plug into the EAR jack on the side of the CTR-41. This connection provides the output signal from the CTR-41 to the TRS-80 (for loading Tape programs into the TRS-80).
- B. Connect the larger gray plug into the AUX jack on the CTR-41. This connection provides the recording signal to record programs from the TRS-80 onto the CTR-41's tape. Also, plug the Dummy Plug (provided with the CTR-41) into the MIC jack (this disconnects the built-in Mic so it won't pick up sounds while you are loading tapes).

**NOTE:** Be sure you always use the Dummy Plug when saving programs on tape (Recording).

- C. Connect the smaller gray plug into the REM jack on the CTR-41. This allows the TRS-80 to automatically control the CTR-41's motor (turn tape motion on and off for recording and playing tapes).

## Notes On Using The Recorder

There are a number of things you should be aware of as you use the Cassette Tape System:

1. To play a tape (load a taped program into the TRS-80), you must have the CTR-41's Volume control set to middle to upper levels, (approximately 4 to 6). Then press the CTR-41's PLAY key and then type **CLOAD** on the TRS-80 and **ENTER** this command. This will start the tape motion. An \* will appear on the top line of the Monitor; a second \* will blink, indicating the program is loading. When loading is done, the TRS-80 will automatically turn the CTR-41 off and flash **READY** on the screen. You are then ready to **RUN** the program (type in **RUN** and hit **ENTER** ).
2. To record a program from the TRS-80, press the CTR-41's RECORD and PLAY keys simultaneously. Then type **CSAVE** followed by a one-letter "file-name" in quotes and **ENTER** this command. When the program has been recorded the TRS-80 will automatically turn the CTR-41 off and display **READY** on the screen. Now you have your program on tape (it still is in the TRS-80 also). Many computer users make a second or even a third recording of the tape, just to be sure they have a good recording.
3. Use the CTR-41's Tape Counter to aid you in locating programs on tapes.
4. For best results, use Radio Shack's special 10 minute per side Computer Tape Cassettes (especially designed for recording computer programs). If you use standard audio tape cassettes, be sure to use top quality, such as Realistic SUPERTAPE. Keep in mind that audio cassettes have lead-ins on both ends (blue non-magnetic mylar material) — you can not record on the leader

---

portion of the tape. Advance the tape past the leader before recording a program.

5. When you are not going to use a CTR-41 for loading or recording programs, do not leave RECORD or PLAY keys down (press STOP).
6. To REWIND or FAST-Forward a cassette, place Recorder in REWIND or FAST-Forward, then type CLOAD and hit **ENTER**. When tape has reached the desired position, push the Reset button inside the Expansion Port access door (rear left of TRS-80). (Instead of using this CLOAD/Reset sequence, you could remove the REMote plug from its jack; however, repeated insertion/removal tends to wear out any plug and is not recommended.)
7. If you want to save a taped program permanently, break off the erase protect tab on the cassette (see CTR-41 Manual).
8. Do not expose recorded tapes to magnetic fields. Avoid placing your tapes near the Power Supply.
9. To check if a tape has a program recorded on it, you can disconnect the plug from the EAR jack (also disconnect the REM plug so you can control the CTR-41 with the keys) and Play the tape; you'll hear the program material from the speaker.
10. For the best results when using a Recorder with the Computer, you should keep the Recorder's heads and tape handling mechanism very clean. A new Recorder should be cleaned before it is used the first time, and cleaned again after every four hours' use. In addition, the tape heads should be demagnetized periodically.

A complete line of recorder accessories (cleaning solution, cotton-tipped swabs, demagnetizer-cassettes, etc.) is available at your local Radio Shack store.

**Special Note:**

Before attempting to load a program from tape into the Computer, be sure the cassette is rewound to a blank portion of the tape preceding the program. If you try to start the load in the middle of a preceding program, you probably will get the Computer "hung up" (in which case you'll have to press Reset and start over).

The same rule applies when you're using the CLOAD? command to compare a taped program with one stored in the Computer.

---

# Tips On Loading Cassette Programs

There are many factors which will affect the performance of a cassette system. The most significant one is volume. Too low a volume may cause some of the information to be missed. Too high a volume may cause distortion and result in the transfer of background noise as valid information. Both of these situations will cause errors.

The recommended volume settings\* for loading from cassette tape are:

	USER GENERATED	PRE-RECORDED RADIO SHACK
LEVEL II	4-6	5 1/2 - 6 1/2
LEVEL I	7-8	7 1/2 - 8 1/2

If the asterisks do not appear during a load, try lowering the volume. It is also a good idea to unplug the EARphone (black) plug and listen for the start of the program. This will tell you exactly where the program starts. If the asterisks appear, but one is not flashing, try increasing the volume setting. If higher volume setting doesn't solve the problem, clean the head.

## Handling Load-Errors

There is a very rare case in which only a minor error may occur in loading a program and no error message will be printed. The best way to check for this, is to List the program. If the program looks OK, use the CLOAD? command to compare the tape version with the one you loaded. If they are not exactly the same, a "BAD" message will be printed. Such a case normally can be remedied with a minor adjustment in the volume setting (usually a slight increase).

---

\*Numbers refer to markings on the Radio Shack CTR-41 Recorder, which run from 0 to 10 (full volume). For different models of Recorders, numbers recommended may not be appropriate. Do a little experimenting.

# 1 / General Information

This chapter will provide you with an overview of LEVEL II BASIC — what some of its special features are, how it differs from LEVEL I, and generally, what you need to get going. In addition, there's a short glossary at the end of the chapter.

## Power-Up

Connect Keyboard-Computer, Video Display and Power Supply as explained in the previous section. Plug Video Display and Power Supply into 120-volt AC outlets. Press POWER buttons on Video Display and at the back of the Keyboard. Give the video tube a few seconds to warm up.

**MEMORY SIZE?** — will appear on the screen. This is your chance to protect a segment of memory so that machine-language programs may be loaded, using a special command, SYSTEM. For normal applications, you won't want to protect any memory, so just press the **ENTER** key without typing in any numbers. This will allow you to write BASIC programs using the full memory capacity of your Computer (for 4K LEVEL II machines, that's 3284 bytes; for 16K LEVEL II machines, it's 15,572 bytes).

**NOTE:** In general, whenever you have typed something in via the keyboard and you want the Computer to "act" on your input, you must first hit the **ENTER** key just as you did with the Level I TRS-80. There are ways to have the Computer respond as soon as you hit a key (without **ENTER**), but these will be covered later.

**RADIO SHACK LEVEL II BASIC**  
**READY**  
->

will appear on the screen. You are now ready to use LEVEL II BASIC.

## Operating Modes

There are four operating modes: Command, Execute, Edit and Monitor. Command and Execute Modes are just like LEVEL I BASIC. In the Command Mode, the Computer responds to commands as soon as they are entered. This is the level you use to write programs and perform computations directly ("calculator mode" of LEVEL I). Whenever the **>\_** appears on the Display, you're in the Command Mode.

The Execute Mode is usually entered by typing **RUN**; this causes BASIC programs to be executed. Unlike LEVEL I, LEVEL II initializes all numeric variables to zero and sets all strings to null when you enter the command **RUN**.

The Edit Mode is a real time-saving feature of LEVEL II. It allows you to edit (alter, add to or delete) the contents of program lines. Instead of retyping an entire program line, you change just the part that needs changing.

NOTE: Whenever Computer encounters a Syntax error during execution, it will go into Edit Mode for that line. To get out of Edit Mode, type "Q" (without quotes).

The Monitor Mode lets you load machine language "object files" into memory. These routines or data can then be accessed by your BASIC programs, or they may be completely independent programs.

## Special Function Keys

LEVEL II BASIC offers the same special function keys as LEVEL I – plus a few extras. The function of the key depends on what mode the Computer is in.

### Command Mode:

<b>ENTER</b>	Effects a carriage return; Computer "looks at" line just typed in and acts accordingly. If line just typed in has no line number, Computer will interpret and execute the statements contained in the line. If Line has a line number, Computer stores the line in program memory.
→	Backspaces the cursor and deletes last character typed in.
<b>SHIFT</b> →	Deletes the line you are typing in, and returns cursor to beginning of logical line.
↑	Linefeed; moves cursor down to next physical line on the Display.
:	Separates BASIC statements contained on the same logical line, to allow multi-statement lines. E.g., <b>PRINT "FIRST STATEMENT":PRINT "SECOND STATEMENT"</b>
→	Moves cursor over to the next tab stop. Tab stops are at positions 0, 8, 16, 24, 32, 40, 48 and 56.
<b>SHIFT</b> →	Converts display to 32 character-per-line format.
<b>CLEAR</b>	Clears the Display and returns it to 64 character-per-line format.

---

### **Execute Mode:**

<b>SHIFT</b> @	Pause; stops program execution. Hitting any key causes execution to be resumed. Hitting <b>SHIFT</b> @ also freezes the Display during a LIST so you can examine program lines.
<b>BREAK</b>	Stops execution. Resume execution by typing CONT.
<b>ENTER</b>	When Computer is awaiting input from the keyboard, <b>ENTER</b> causes Computer to "look at" what you've typed in.

For Edit Mode special function keys, see Chapter 9.

### **Variable Names**

Variable names must begin with a letter (A-Z) and may be followed by another letter or digit (0-9). So the following are all valid and distinct variable names:

A A2 AA AZ G9 GP M MU ZZ Z1  
Variable names may be longer than two characters, but only the first two characters will be used by the computer to distinguish between variables. For example "SUM", "SUB" and "SU" will be treated as one and the same variable by LEVEL II BASIC.

As you can imagine, this gives you plenty of variable names to use in LEVEL II (in the neighborhood of 900). However, you cannot use variable names which contain words with special meaning in the BASIC language. For example, "XON" cannot be used as a variable name, since it contains the BASIC keyword "ON". The complete list of "reserved words" which cannot be used in variable names appears in Appendix A of this Manual.

### **Variable Types**

There are four types of variables in LEVEL II: integer, single precision, double precision, and string variables. The first three types are used to store numerical values with various degrees of precision; the last type stores strings (sequences) of characters - letters, blanks, numbers and special symbols - up to 255 characters long. LEVEL I only allowed two string variables, A\$ and B\$ - but LEVEL II allows you to use any variable name for strings, simply by adding the string declaration character, \$, to the variable name. There are declaration characters for the other variable types, too: Here's a complete listing:

Variable Type	Declaration Character	Examples	Typical values stored
integer (whole numbers greater than -32769 and less than +32768)	%	A%, B%	-30, 123, 3, 5001
single precision (6 significant figures)	!	A!, A!A!, Z!	1, -50, .123456, 353421
double precision (16 significant figures)	*	A *, ZZ *, C *	-300.12345678, 3.141592653589 1.000000000000001
double precision with scientific notation (for entering constants or during output of large or small numbers)	D	"A#=1.2345678901D+12"	1.2345678901 x 10 <sup>12</sup>
string (up to 255 characters)*	\$	A\$1, GTS\$, HIS	"JOHN Q. DOE", "WHISTLE-STOP" "-1 + 2 * ?"

The same variable name may be used for different variable types, and the Computer will still keep them distinct, because of the type declaration character: For example, A\$, A%, A!, A\* are distinct variable names.

Variables without declaration characters are assumed to be single-precision; this assumption can be changed with DEFine statements (Chapter 4).

## Arrays

Any valid variable name can be used to name an array in LEVEL II BASIC; and arrays are not limited to one dimension. The DIMension statement is used to define arrays at the beginning of a program. Depending on the variable type used, an array may contain strings, integers, double precision values, etc. A whole chapter of this Manual is devoted to arrays:

Examples: A\$(X,Y,Z) would be a three-dimensional array containing string values  
 G3(I,J) would be a two-dimensional array containing numerical single-precision values  
 G#(1) would be a one dimensional array of double precision values.

## Arithmetic Operators

LEVEL II uses the same arithmetic operators as LEVEL I:  
 + (addition), - (subtraction), \* (multiplication) and / (division).  
 And there's a new, very handy operator:  $\downarrow$  (exponentiation:  
 $2 \downarrow 3 = 8$ ).

For example, to compute  $6 * 2^{1/3}$ : PRINT 6\*2  $\downarrow$  (1/3)

NOTE: Some TRS-80's generate a [ character instead of the  $\downarrow$  arrow.

## Relational Operators

These are the same as LEVEL I.

< (less than) > (greater than) = (equal to)

<> (not equal to) <= (less than or equal to) >= (greater than or equal to)

These operators are useful both for IF . . . THEN statements and for logical arithmetic.

Example: 100 IF C<=0 THEN C=127

## Logical Operators

In LEVEL I BASIC, \* and + were used to represent the logical operators AND and OR. In LEVEL II, we don't use symbols, we use AND and OR directly. We also have another operator, NOT.

Examples:

50 IF Q = 13 AND R2 = 0 THEN PRINT "READY"

100 Q = (G1<0) AND (G2<L) Q = -1 if both expressions are True; otherwise Q = 0

200 Q = (G1<0) OR (G2<L) Q = -1 if either expression is True; otherwise Q = 0

300 Q = NOT(C>3) Q = -1 if the expression is False; Q = 0 if it is True

400 IF NOT (P AND Q) THEN PRINT "P AND Q ARE NOT BOTH EQUAL TO -1"

500 IF NOT (P OR Q) THEN PRINT "NEITHER P NOR Q EQUALS -1"

## String Operators

Strings may be compared and concatenated ("strung together") in LEVEL II. A whole chapter of this Manual is devoted to string manipulations.

Symbol	Meaning	Example
<	precedes alphabetically	"A" < "B"
>	follows alphabetically	"JOE" > "JIM"
=	equals	B\$ = "WIN"
<>	does not equal	IF AS<>BS THEN PRINT AS
<=	precedes or equals	IF AS<=AZ\$ PRINT "DONE"
>=	follows or equals	IF L1\$>="SMITH" PRINT L1\$
+	concatenate the two strings	AS = CS+C1\$ AS = "TR5-" + "80"

---

## **Order of Operations**

Operations in the innermost level of parentheses are performed first, then evaluation proceeds to the next level out, etc. Operations on the same nesting level are performed according to the following hierarchy:

Exponentiation:  $A \downarrow B$

Negation:  $-X$

$\cdot, /$  (left to right)

$+, -$  (left to right)

$<, >, =, <=, >=, <>$  (left to right)

NOT

AND

OR

## **Intrinsic Functions**

Most of the subroutines in the LEVEL I manual are built-in to LEVEL II. They are faster, more accurate, and much easier to use.

## **Graphics**

Level II has the same SET, RESET and POINT functions as LEVEL I for turning graphics blocks on and off and determining whether an individual block is on or off. (There are a few differences – see Chapter 8.)

A big feature of LEVEL II is the selectable display – either 64 characters per line or 32 characters per line (c/l). When the machine is turned on it is in the 64 c/l mode; hit SHIFT and  $\leftarrow$  simultaneously to change to 32 c/l. Display will return to 64 c/l whenever a **CLS** or **NEW** is executed or CLEAR key is hit. You can also shift to 32 c/l by executing a **PRINT CHR\$ (23)**. More on this in Chapter 5.

---

## **Error Messages**

LEVEL I pointed out errors by printing **HOW?**, **WHAT?** or **SORRY** along with the offending program line with a question mark inserted at the point of error. LEVEL II gives you much more specific information about what type of error occurred, using a set of Error Codes (see Appendix). The offending program line is also pointed out, but it's up to you to locate the error in the line.

---

---

## **Abbreviations**

Very few abbreviations are allowed in LEVEL II. Ex-LEVEL I users will have to forget about R., L., P., etc. Although LEVEL II doesn't allow these short-forms, it stores the programs more efficiently than LEVEL I did, so you can still pack a lot of program into a small amount of memory space.

The abbreviations are:

- ? for PRINT, and
- ' for :REM
- . for last line entered, listed, edited, or in which an error occurred.

## **Keyboard Rollover**

With the LEVEL I TRS-80 (and many other computers) you have to release one key before the Computer will allow entry of another key. LEVEL II lets you hit the second key before you have released the first key. This is great for you touch typists.

---

## Glossary for LEVEL II BASIC

**address** a value specifying the location of a byte in memory;  
decimal values are used in LEVEL II

**alphanumerics** the set of letters A-Z, the numerals 0-9, and various punctuation marks and special characters

**argument** the value which is supplied to a function and then operated on to derive a result

**array** an arrangement of elements in one or more dimensions

**ASCII** American Standard Code for Information Interchange; in LEVEL II BASIC, decimal values are used to specify ASCII codes

**assembler** a program that converts a symbolic-language program into a machine-language program

**BASIC** Beginners All-purpose Symbolic Instruction Code

**baud** signaling speed in bits per second; LEVEL II's cassette interface operates at 500 baud (500 bits per second)

**binary number** a number represented in the base-two number system using only binary digits "0" and "1"

**bit** binary-digit, the smallest memory cell in a computer

**byte** the smallest memory unit that can be addressed in BASIC, consisting of 8 consecutive bits

**decimal number** a number represented in the base-ten number system using the digits 0-9

**expression** a combination of one or more operations, constants and variables

**file** an organized collection of related data

**hexadecimal number** a number represented in the base-16 number system using the digits 0-9 plus A, B, C, D, E, F

**intrinsic function** a function (usually a complicated function) that may be "built-in" to the Computer's ROM and may be used directly in a BASIC statement

**logical expression** an expression which is either True or False:  
if True, -1 is returned; if False, 0 is returned

**machine language** the language used directly by the Computer, written as binary-coded instructions

**port** one of 256 channels through which data can be input to or output from the Computer

**RAM** Random Access Memory; memory available to the user for writing programs and storing data

**ROM** Read Only Memory; memory which is permanently programmed and may be read but not written into; LEVEL II BASIC is stored in ROM

**routine** a sequence of instructions to carry out a certain function

**statement** a complete instruction in BASIC

**string** a sequence of alphanumeric characters ranging in length from zero (the "null" string) to 255

**subroutine** a sequence of instructions for performing a desired function; may be accessed many times from various points in a program

**variable** a quantity that can take on any of a given set of values

**variable name** the label by which a given variable is addressed

## 2/Commands

Whenever a prompt > is displayed, your Computer is in the Command Mode. You can type in a command, **ENTER** it, and the Computer will respond immediately. This chapter describes the commands you'll use to control the Computer — to change modes, begin input and output procedures, alter program memory, etc. All of these commands — except CONT — may also be used inside your program as statements. In some cases this is useful; other times it is just for very specialized applications.

The commands described in this chapter are:

AUTO	CONT	EDIT	SYSTEM
CLEAR	CSAVE	LIST	TROFF
CLOAD	DELETE	NEW	TRON
CLOAD?		RUN	

### **AUTO** *line number, increment*

Turns on an automatic line numbering function for convenient entry of programs — all you have to do is enter the actual program statements. You can specify a beginning line number and an increment to be used between line numbers. Or you can simply type AUTO and hit **ENTER**, in which case line numbering will begin at 10 and use increments of 10. Each time you hit **ENTER**, the Computer will advance to the next line number.

#### Examples:

**AUTO**  
**AUTO 5,5**  
**AUTO 100**  
**AUTO 100,25**

#### to use line numbers

10, 20, 30, ...  
5, 10, 15, ...  
100, 110, 120, ...  
100, 125, 150, ...

To turn off the AUTO function, hit the BREAK key. (Note: When AUTO brings up a line number which is already being used, an asterisk will appear beside the line number. If you do not wish to re-program the line, hit the BREAK key to turn off AUTO function.)

## **CLEAR n**

When used without an argument (e.g., type CLEAR and hit **ENTER**), this command resets all numeric variables to zero, and all string variables to null. When used with an argument (e.g., CLEAR 100), this command performs a second function in addition to the one just described: it makes the specified number of bytes available for string storage.

**Example:** CLEAR 100 makes 100 bytes available for strings. When you turn on the Computer a CLEAR 50 is executed automatically.

## **CLOAD "file name"**

Lets you load a BASIC program stored on cassette. Place recorder/player in Play mode (be sure the proper connections are made and cassette tape has been re-wound to proper position).

**NOTE:** In LEVEL II, CLOAD and CSAVE operate at a transfer rate of 500 baud. This is twice as fast as LEVEL I's cassette transfer rate. Therefore the Volume setting used during CLOAD should be correspondingly lower. For example, if you're using Radio Shack's CTR-41 Cassette Recorder, try a setting of between 4 and 6 on the Volume control when loading programs or data you placed on the tape. For loading pre-recorded programs, a higher Volume level may be required. Do a little experimenting.

Entering CLOAD will turn on the cassette machine and load the first program encountered. LEVEL II also lets you specify a desired "file" in your CLOAD command. For example, CLOAD "A" will cause the Computer to ignore programs on the cassette until it comes to one labeled "A". So no matter where file "A" is located on the tape, you can start at the beginning of the tape; file "A" will be picked out of all the files on the tape and loaded. As the Computer is searching for file "A", the names of the files encountered will appear in the upper right corner of the Display, along with a blinking "\*".

Only the first character of the file name is used by the Computer for CLOAD, CLOAD?, and CSAVE operations.

Loading a program from tape automatically clears out the previously stored program. See also CSAVE.

## **CLOAD? "file name"**

Lets you compare a program stored on cassette with one presently in the Computer. This is useful when you have dumped a program onto tape (using CSAVE) and you wish to check that the transfer was successful. If you labeled the file when you CSAVED it, you may specify CLOAD? "file-name". Otherwise, if you don't specify a file-name, the first program encountered will be tested. During CLOAD?, the program on tape and the program in memory are

---

compared byte for byte. If there are any discrepancies (indicating a bad dump), the message "BAD" will be displayed. In this case, you should CSAVE the program again. (CLOAD?, unlike CLOAD, does not erase the program memory.)

## CONT

When program execution has been stopped (by the BREAK key or by a STOP statement in the program), type CONT and **ENTER** to continue execution at the point where the stop or break occurred. During such a break or stop in execution, you may examine variable values (using PRINT) or change these values. Then type CONT and **ENTER** and execution will continue with the current variable values. CONT, when used with STOP and the BREAK key, is primarily a debugging tool.

**NOTE:** You cannot use CONT after EDITing your program lines or otherwise changing your program. CONT is also invalid after execution has ended normally.

See also STOP.

## CSAVE "*file name*"

Stores the resident program on cassette tape. (Cassette recorder must be properly connected, cassette loaded, and in the Record mode, before you enter the CSAVE command.) You must specify a file-name with this command. This file-name may be any alphanumeric character other than double-quotes (""). The program stored on tape will then bear the specified file-name, so that it can be located by a CLOAD command which asks for that particular file-name. You should always write the appropriate file-names on the cassette case for later reference.

Examples:

**CSAVE "I"**        dumps resident program and attaches label "I"  
**CSAVE "A"**        dumps resident program and attaches label "A"

See also CLOAD.

## DELETE *line number-line number*

Erases program lines from memory. You may specify an individual line or a sequence of lines, as follows:

<b>DELETE <i>line number</i></b>	erases one line as specified
<b>DELETE <i>line number-line number</i></b>	erases all program lines starting with first line number specified and ending with last number specified
<b>DELETE-<i>line number</i></b>	erases all program lines up to and including the specified number

The upper line number to be deleted must be a currently used number.

---

**Examples:**

<b>DELETE 5</b>	erases line 5 from memory (error if line 5 not used)
<b>DELETE 11-18</b>	erases lines 11, 18 and every line in between

If you have just entered or edited a line, you may delete that line simply by entering **DELETE**. (use a period instead of the line number).

**EDIT line number**

Puts the Computer in the Edit Mode so you can modify your resident program. The longer and more complex your programs are, the more important **EDIT** will be. The Edit Mode has its own selection of subcommands, and we have devoted Chapter 9 to the subject.

**LIST line number-line number**

Instructs the Computer to display all program lines presently stored in memory. If you enter **LIST** without an argument, the entire program will scroll continuously up the screen. To stop the automatic scrolling, press SHIFT and @ simultaneously. This will freeze the display. Press any key to release the "pause" and continue the automatic scrolling.

To examine one line at a time, specify the desired line number as an argument in the **LIST** command. To examine a certain sequence of program lines, specify the first and last lines you wish to examine.

**Examples:**

<b>LIST 50</b>	displays line 50
<b>LIST 50-150</b>	displays line 50, 150 and everything in between
<b>LIST 50-</b>	displays line 50 and all higher-numbered lines
<b>LIST.</b>	displays current line (line just entered or edited)
<b>LIST -50</b>	displays all lines up to and including line 50

**NEW**

Erases all program lines, sets numeric variables to zero and string variables to null. It does not change the string space allocated by a previous **CLEAR number** statement.

**RUN line number**

Causes Computer to execute the program stored in memory. If no line number is specified, execution begins with lowest numbered program line. If a line number is specified, execution begins with the line number. (Error occurs if you specify an unused line number.) Whenever **RUN** is executed, Computer also executes a **CLEAR**.

---

#### Examples:

**RUN** execution begins at lowest-numbered line  
**RUN 100** execution begins at line 100

**RUN** may be used inside a program as a statement; it is a convenient way of starting over with a clean slate for continuous-loop programs such as games.

## SYSTEM

Puts the Computer in the Monitor Mode, which allows you to load object files (machine-language routines or data). Radio Shack offers several machine-language software packages, such as the IN-MEMORY INFORMATION SYSTEM. You can also create your own object files using the TRS-80 EDITOR/ASSEMBLER, which is itself an object file.

To load an object file: Type **SYSTEM** and **ENTER**

\*? will be displayed. Now enter the file-name (no quotes are necessary) and the tape will begin loading. When loading is complete, another

\*? will be displayed. Type in a slash-symbol / followed by the address (in decimal form) at which you wish execution to begin. Or you may simply hit the slash-symbol and **ENTER** without any address. In this case execution will begin at the address specified by the object file.

## TROFF

Turns off the Trace function. See **TRON**.

## TRON

Turns on a Trace function that lets you follow program-flow for debugging and execution analysis. Each time the program advances to a new program line, that line number will be displayed inside a pair of brackets.

For example, enter the following program:

```
10 PRINT "START"  
20 PRINT "GOING"  
30 GOTO 20  
40 PRINT "GONE..
```

Now type in **TRON**, **ENTER**, and **RUN**, **ENTER**

```
<10> START  
<20> GOING  
<30> <20> GOING  
<30> <20> GOING  
etc.
```

(Press SHIFT and @ simultaneously to pause execution and freeze display. Press any key to continue with execution.)  
As you can see from the display, the program is in an infinite loop.

The numbers show you exactly what is going on. (To stop execution, hit BREAK key.)

To turn off the Trace function, enter TROFF. TRON and TROFF may be used inside programs to help you tell when a given line is executed.

For example

```
50 TRON  
60 X=X*3.14159  
70 TROFF
```

might be helpful in pointing out every time line 60 is executed (assuming execution doesn't jump directly to 60 and bypass 50). Each time these three lines are executed, <60> <70> will be displayed. Without TRON, you wouldn't know whether the program was actually executing line 60. After a program is debugged, TRON and TROFF lines can be removed.

## 3/Input-Output

The statements described in this chapter let you send data from Keyboard to Computer, Computer to Display, and back and forth between Computer and the Cassette interface. These will primarily be used inside programs to input data and output results and messages.

Statements covered in this chapter:

PRINT	INPUT
@ (PRINT modifier)	DATA
TAB (PRINT modifier)	READ
USING (PRINT formatter)	RESTORE
	PRINT * (Output to Cassette)
	INPUT * (Input to Cassette)

### **PRINT item list**

Prints an item or a list of items on the Display. The items may be either string constants (messages enclosed in quotes), string variables, numeric constants (numbers), variables, or expressions involving all of the preceding items. The items to be PRINTed may be separated by commas or semi-colons. If commas are used, the cursor automatically advances to the next print zone before printing the next item. If semi-colons are used, no space is inserted between the items printed on the Display.

Examples:

```
-----  
30 X=5  
100 PRINT 25;"IS EQUAL TO";X + 2  
RUN
```

25 IS EQUAL TO 25

```
-----  
10 AS="STRING"  
20 PRINT AS:AS,AS;" ";AS  
RUN
```

STRINGSTRING     STRING STRING

Positive numbers are printed with a leading blank (instead of a plus sign); all numbers are printed with a trailing blank; and no blanks are inserted before or after strings (you can insert them with quotes as in line 20).

```
-----  
10 PRINT "ZONE 1","ZONE 2","ZONE 3","ZONE 4","ZONE 1 ETC"
```

RUN

ZONE 1	ZONE 2	ZONE 3	ZONE 4
ZONE 1 ETC			

There are four 16-character print zones per line.

```
-----  
10 PRINT "ZONE 1","ZONE 3"
```

RUN

ZONE 1	ZONE 3
--------	--------

The cursor moves to the next print zone each time a comma is encountered.

```
-----  
10 PRINT "PRINT STATEMENT #10 ";  
20 PRINT "PRINT STATEMENT #20"
```

RUN

PRINT STATEMENT #10 PRINT STATEMENT #20

A trailing semi-colon over-rides the cursor-return so that the next PRINT begins where the last one left off (see line 10).

If no trailing punctuation is used with PRINT, the cursor drops down to the beginning of the next line.

### **PRINT @ position, item list**

Specifies exactly where printing is to begin. (AT was used in LEVEL 1 BASIC.) The @ modifier must follow PRINT immediately, and the location specified must be a number from 0 to 1023. Refer to the Video Display worksheet, Appendix E, for the exact position of each location 0-1023:

```
100 PRINT @ 550, "LOCATION 550"
```

RUN this to find out where location 550 is.

Whenever you PRINT @ on the bottom line of the Display, there is an automatic line-feed, causing everything displayed to move up one line. To suppress this, use a trailing semi-colon at the end of the statement.

Example:

```
100 PRINT @ 1000, 1000;
```

### **PRINT TAB (expression)**

Moves the cursor to the specified position on the current line (or on succeeding lines if you specify TAB positions greater than 63). TAB may be used several times in a PRINT list.

The value of expression must be between 0 and 255 inclusive.

**Example:**

```
10 PRINT TAB(5) "TABBED 5";TAB(25) "TABBED 25"
```

No punctuation is required after a TAB modifier.

```
5 X=3
10 PRINT TAB(X) X; TAB(X + 2) X + 2; TAB(X + 3) X + 3
```

Numerical expressions may be used to specify a TAB position. This makes TAB very useful for graphs of mathematical functions, tables, etc. TAB cannot be used to move the cursor to the left. If cursor is beyond the specified position, the TAB is ignored.

### **PRINT USING *string; item list***

**PRINT USING** – This statement allows you to specify a format for printing string and numeric values. It can be used in many applications such as printing report headings, accounting reports, checks ... or wherever a specific print format is required.

The **PRINT USING** statement uses the following format:

```
PRINT USING string : value
```

*String* and *value* may be expressed as variables or constants. This statement will print the expression contained in the *string*, inserting the numeric value shown to the right of the semicolon as specified by the field specifiers.

The following field specifiers may be used in the *string*:

- \* This sign specifies the position of each digit located in the numeric value. The number of \* signs you use establishes the numeric field. If the numeric field is greater than the number of digits in the numeric value, then the unused field positions to the left of the number will be displayed as spaces and those to the right of the decimal point will be displayed as zeros.

The decimal point can be placed anywhere in the numeric field established by the \* sign. Rounding-off will take place when digits to the right of the decimal point are suppressed.

The comma – when placed in any position between the first digit and the decimal point – will display a comma to the left of every third digit as required. The comma establishes an additional position in the field.

- \*\* Two asterisks placed at the beginning of the field will cause all unused positions to the left of the decimal to be filled with asterisks. The two asterisks will establish two more positions in the field.

**\$\$** Two dollar signs placed at the beginning of the field will act as a floating dollar sign. That is, it will occupy the first position preceding the number.

**\*\*\*\$** If these three signs are used at the beginning of the field, then the vacant positions to the left of the number will be filled by the \* sign and the \$ sign will again position itself in the first position preceding the number.

- + When a + sign is placed at the beginning or end of the field, it will be printed as specified as a + for positive numbers or as a - for negative numbers.
- When a - sign is placed at the end of the field, it will cause a negative sign to appear after all negative numbers and will appear as a space for positive numbers.

**% spaces %** To specify a string field of more than one character, % spaces % is used. The length of the string field will be 2 plus the number of spaces between the percent signs.

- ! Causes the Computer to use the first string character of the current value.

The following program will help demonstrate these format specifiers:

```
10 INPUT A$, A
20 PRINT USING A$;A
30 GOTO 10
```

RUN this program and try various specifiers and strings for A\$ and various values for A.

#### For Example:

```
RUN
7 ##.##, 12.12
12.12
7 ***.##, 12.12
12.12
7 ##.##, 121.21
% 121.21
```

The % sign is automatically printed if the field is not large enough to contain the number of digits found in the numeric value. The entire number to the left of the decimal will be displayed preceded by this sign.

```
7 ##.##, 12.127
12.13
```

Note that the number was rounded to two decimal places.

```
? +##.##,12.12
+12.12
? +##.##, -12.12
-12.12
? ##.##+,12.12
12.12+
? ##.##+, -12.12
12.12-
? ##.##-, 12.12
12.12
? ##.## -, -12.12
12.12-
? ##.##, 12.12
**12
? ***.##, 1212.12
1212.12
? $##.##, 12.12
$12.12
? ##.####, 12121.2
12.121.2
? ####.##, 12121.2
12.121
? ###, 1212
% 1212
```

Another way of using the PRINT USING statement is with the string field specifiers "!" and % spaces %.

Examples:

```
PRINT USING "I"; string
PRINT USING "%      %"; string
```

The "!" sign will allow only the first letter of the string to be printed. The "% spaces %" allows spaces +2 characters to be printed. Again, the *string* and specifier can be expressed as string variables. The following program will demonstrate this feature:

```
10 INPUT AS, BS
20 PRINT USING AS; BS
30 GOTO 10
```

and RUN it:

```
? I, ABCDE
  A
? %%, ABCDE
  AB
? %  %, ABCD
```

Multiple strings or string variables can be joined together (concatenated) by these specifiers. The "!" sign will allow only the first letter of each string to be printed. For example:

```
10 INPUT AS, BS, CS
20 PRINT USING "I"; AS; BS; CS
```

And RUN it ...

```
? ABC,DEF,GHI  
A D G
```

By using more than one "!" sign, the first letter of each string will be printed with spaces inserted corresponding to the spaces inserted between the "!" signs. To illustrate this feature, make the following change to the last little program:

```
20 PRINT USING "I ! I"; AS, BS, CS
```

And RUN it ...

```
? ABC,DEF,GHI  
A D G
```

Spaces now appear between letters A, D and G to correspond with those placed between the three "!" signs.

Try changing "I ! I" to "%%" in line 20 and run the program.

The following program demonstrates one possible use for the PRINT USING statement.

```
10 CLS  
20 AS = "***$##,###.## DOLLARS"  
30 INPUT "WHAT IS YOUR FIRST NAME": FS  
40 INPUT "WHAT IS YOUR MIDDLE NAME": MS  
50 INPUT "WHAT IS YOUR LAST NAME": LS  
60 INPUT "ENTER THE AMOUNT PAYABLE": P  
70 CLS: PRINT "PAY TO THE ORDER OF":  
80 PRINT USING "I I I"; FS; "."; MS; ".":  
90 PRINT LS  
100 PRINT: PRINT USING AS: P  
110 GOTO 110
```

RUN the program. Remember, to save programming time, use the "?" sign for PRINT. Your display should look something like this:

```
WHAT IS YOUR FIRST NAME? JOHN  
WHAT IS YOUR MIDDLE NAME? PAUL  
WHAT IS YOUR LAST NAME? JONES  
ENTER AMOUNT PAYABLE? 12345.6  
  
PAY TO THE ORDER OF J. P. JONES  
  
*****$12,345.60 DOLLARS
```

If you want to use an amount greater than 999,999 without rounding off or going into scientific notation, then simply add the double precision sign (#) after the variable P in Lines 60 and 100. You will then be able to use amounts up to 16 decimal places long.

## **INPUT item list**

Causes Computer to stop execution until you enter the specified number of values via the keyboard. The INPUT statement may specify a list of string or numeric variables to be input. The items in the list must be separated by commas.

-----  
**100 INPUT XS, X1, ZS, Z1**

This statement calls for you to input a string-literal, a number, another string literal, and another number, in that order. When the statement is encountered, the Computer will display a

?—

You may then enter the values all at once or one at a time. To enter values all at once, separate them by commas. (If your string literal includes leading blanks, colons, or commas, you must enclose the string in quotes.)

For example, when line 100 (above) is RUN and the Computer is waiting for your input, you could type

**JIM,50,JACK,40** (ENTER)

The Computer will assign values as follows:

**XS="JIM"      X1=50      ZS="JACK"      Z1=40**

If you **ENTER** the values one at a time, the Computer will display a

?—

... indicating that more data is expected. Continue entering data until all the variables have been set, at which time the Computer will advance to the next statement in your program.

-----  
Be sure to enter the correct type of value according to what is called for by the INPUT statement. For example, you can't input a string-value into a numerical variable. If you try to, the Computer will display a

**TREDO**

?—

and give you another chance to enter the correct type of data value, starting with the *first* value called for by the INPUT list.

**NOTE:** You cannot input an expression into a numerical value — you must input a simple numerical constant. (LEVEL I allowed you to input an expression or even a variable into a numerical variable.)

**Example:**

```
100 INPUT X1, Y1$  
200 PRINT X1, Y1$  
RUN  
1_ [you type:] 7+3 [ENTER]  
1 REDO  
2_ [you type:] 10 [ENTER]  
??_ [you type:] "THIS IS A COMMA:,"  
10 THIS IS A COMMA:.
```

It was necessary to put quotes around "THIS IS A COMMA:," because the string contained a comma.

If you **ENTER** more data elements than the INPUT statement specifies, the Computer will display the message

**TEXTRA IGNORED**

and continue with normal execution of your program.

You can also include a "prompting message" in your INPUT statement. This will make it easier to input the data correctly. The prompting message must immediately follow "INPUT", must be enclosed in quotes, and must be followed by a semi-colon.

**Example:**

```
100 INPUT "ENTER YOUR NAME AND AGE (NAME,AGE)":NS.A  
(RUN)  
ENTER YOUR NAME AND AGE (NAME,AGE)?...
```

**DATA item list**

Lets you store data inside your program to be accessed by READ statements. The data items will be read sequentially, starting with the first item in the first DATA statement, and ending with the last item in the last DATA statement. Items in a DATA list may be string or numeric constants – no expressions are allowed. If your string values include leading blanks, colons or commas, you must enclose these values in quotes.

It is important that the data types in a DATA statement match up with the variable types in the corresponding READ statement. DATA statements may appear anywhere it is convenient in a program. Generally, they are placed consecutively, but this is not required.

**Examples:**

```
500 READ N1S,N2S,N1,N2
1000 DATA "SMITH, J.R.", "WILSON, T.M."
2000 DATA 150,175
```

See **READ, RESTORE.**

**READ item list**

Instructs the Computer to read a value from a **DATA** statement and assign that value to the specified variable. The first time a **READ** is executed, the first value in the first **DATA** statement will be used; the second time, the second value in the **DATA** statement will be read. When all the items in the first **DATA** statement have been read, the next **READ** will use the first value in the second **DATA** statement; etc. (An Out-of-Data error occurs if there are more attempts to **READ** than there are **DATA** items.) The following program illustrates a common application for **READ/DATA** statements.

```
50 PRINT "NAME","AGE"
100 READ NS
110 IF NS="END" PRINT "END OF LIST":END
120 READ AGE
130 IF AGE < 18 PRINT NS,AGE
140 GOTO100
150 DATA "SMITH, JOHN",30,"ANDERSON,T.M.",20
160 DATA "JONES, BILL",15,"DOE,SALLY",21
170 DATA "COLLINS,W.P.",17,END
RUN
NAME      AGE
JONES, BILL    15
COLLINS,W.P.    17
END OF LIST
```

**READY**

>—

The program locates and prints all the minors' names from the data supplied. Note the use of an END string to allow READING lists of unknown length.

See **DATA, RESTORE**

## **RESTORE**

Causes the next READ statement executed to start over with the first item in the first DATA statement. This lets your program re-use the same DATA lines.

**Example:**

```
100  READ X
110  RESTORE
120  READ Y
130  PRINT X,Y
140  DATA 50,60
RUN
      50          50
READY
>_
```

Because of the RESTORE statement, the second READ statement starts over with the first DATA item.

See **READ, DATA**

## **PRINT #<1>, *item list***

Prints the values of the specified variables onto cassette tape. (Recorder must be properly connected and set in Record mode when this statement is executed.) The PRINT # statement must always specify a device number. This is because the TRS-80 can actually input/output to two cassette machines, once you've added the Expansion Interface described in Chapter 10. For normal use with just one recorder connected, the device number must be -1, e.g., PRINT #-1 (followed by a comma and then the item list).

**Example:**

```
5  A1=-30.334:B$="STRING-VALUE"
10 PRINT #-1,A1,B$,"THAT'S ALL"
```

This stores the current values of A1 and B\$, and also the string-literal "THAT'S ALL". The values may be input from tape later using the INPUT# statement. The INPUT# statement must be identical to the PRINT# statement in terms of number and type of items in the PRINT#/INPUT# lists. See INPUT#.

### **Special Note:**

The values represented in *item list* must not exceed 255 characters total; otherwise all characters after the first 255 will be truncated. For example, PRINT #-1, A#,B#,C#,D#,E#,F#,G#,H#,I#,J#,A\$ will probably exceed the maximum record length if A\$ is longer than about 75 characters. In such a case, A\$ would not be recorded, and when you try to INPUT #-1 the data, an OD (Out of Data) error will occur.

---

## **INPUT #-1, item list**

Inputs the specified number of values stored on cassette and assigns them to the specified variable names. Like the PRINT# statement, INPUT# requires that you specify a device number. (This will make more sense when you have added the Expansion Interface and are using a dual cassette system. See Chapter 10.) Use Device number -1 for normal applications without the Expansion Interface. e.g., INPUT#-1, list.

### **Example:**

```
50 INPUT #-1,X,PS,T$
```

When this statement is executed, the Computer will turn on the tape machine, input values in the order specified, then turn off the tape machine and advance to the next statement. If a string is encountered when the INPUT list calls for a number, a bad file data error will occur. If there are not enough data items on the tape to "fill" the INPUT statement, an Out of Data error will occur.

The Input list must be identical to the Print list that created the taped data-block (same number and type of variables in the same sequence.)

## **Sample Program**

Use the two-line program supplied in the PRINT# description to create a short data file. Then rewind the tape to the beginning of the data file, make all necessary connections, and put cassette machine in Play mode. Now run the following program.

```
10 INPUT#-1,A1,BS,LS
20 PRINT A1,BS,LS
30 IF LS="THAT'S ALL"END
40 GOTO 10
```

This program doesn't care how long or short the data file is, so long as:

- 1) the file was created by successive PRINT# statements identical in form to line 10
- 2) the last item in the last data triplet is "THAT'S ALL".

## 4/Program Statements

LEVEL II BASIC makes several assumptions about how to run your programs. For example:

- Variables are assumed to be single-precision (unless you use type declaration characters — see Chapter 1, "Variable Types").
- A certain amount of memory is automatically set aside for strings and arrays — whether you use all of it or not.
- Execution is sequential, starting with the first statement in your program and ending with the last.

The statements described in this chapter let you over-ride these assumptions, to give your programs much more versatility and power.

NOTE: All LEVEL II statements except INPUT and INPUT# can be used in the Command Mode as well as in the Execute Mode.

Statements described in this chapter:

Type Definition	Assignment & Allocation	Sequence of Execution	Tests (Conditional Statements)
DEFINT	CLEAR #	END	IF
DEFSNG	DIM	STOP	THEN
DEFDBL	LET	GOTO	ELSE
DEFSTR		GOSUB	
		ON ... GOTO	
		ON ... GOSUB	
		FOR-NEXT-STEP	
		ERROR	
		ON ERROR GOTO	
		RESUME	
		REM	

This chapter also contains a discussion of data conversion in LEVEL II BASIC; this will let you predict and control the way results of expressions, constants, etc., will be stored — as integer, single precision or double precision.

### **DEFINT *letter range***

Variables beginning with any letter in the specified range will be stored and treated as integers, unless a type declaration character is added to the variable name. This lets you conserve memory, since

integer values take up less memory than other numeric types. And integer arithmetic is faster than single or double precision arithmetic. However, a variable defined as integer can only take on values between -32768 and +32767 inclusive.

**Examples:**

**10 DEFINT A,I,N**

After line 10, all variables beginning with A, I or N will be treated as integers. For example; A1, AA, I3 and NN will be integer variables. However, A1#, AA#, I3# would still be double precision variables, because of the type declaration characters, which always over-ride DEF statements.

**10 DEFINT I-N**

Causes variables beginning with I, J, K, L, M or N to be treated as integer variables.

DEFINT may be placed anywhere in a program, but it may change the meaning of variable references without type declaration characters. Therefore it is normally placed at the beginning of a program.

See DEFNSNG, DEFDBL, and Chapter 1, "Variable Types".

**DEFSNG *letter range***

Causes any variable beginning with a letter in the specified range to be stored and treated as single precision, unless a type declaration character is added. Single precision variables and constants are stored with 7 digits of precision and printed out with 6 digits of precision. Since all numeric variables are assumed to be single precision unless DEFined otherwise, the DEFSNG statement is primarily used to re-define variables which have previously been defined as double precision or integer.

**Example:**

**100 DEFSNG I, W-Z**

Causes variables beginning with the letter I or any letter W through Z to be treated as single precision. However, I% would still be an integer variable, and I# a double precision variable, due to the use of type declaration characters.

See DEFINT, DEFDBL, and Chapter 1, "Variable Types".

**DEFDBL *letter range***

Causes variables beginning with any letter in the specified range to be stored and treated as double-precision, unless a type declaration character is added. Double precision allows 17 digits of precision; 16 digits are displayed when a double precision variable is PRINTed.

---

**Example:**

**10 DEFDBL S-Z, A-E**

Causes variables beginning with one of the letters S through Z or A through E to be double precision.

DEFDBL is normally used at the beginning of a program, because it may change the meaning of variable references without type declaration characters.

See DEFINT, DEFNSNG, and Chapter 1, "Variable Types".

### **DEFSTR letter range**

Causes variables beginning with one of the letters in the specified range to be stored and treated as strings, unless a type declaration character is added. If you have CLEARED enough string storage space, each string can store up to 255 characters.

**Example:**

**10 DEFSTR L-Z**

Causes variables beginning with any letter L through Z to be string variables, unless a type declaration character is added. After line 10 is executed, the assignment L1 = "WASHINGTON" will be valid.

See CLEAR n, Chapter 1, "Variable Types", and Chapter 5.

### **CLEAR n**

When used with an argument *n* (*n* can be a constant or an expression), this statement causes the Computer to set aside *n* bytes for string storage. In addition all variables are set to zero. When the TRS-80 is turned on, 50 bytes are automatically set aside for strings.

The amount of string storage CLEARED must equal or exceed the greatest number of characters stored in string variables during execution; otherwise an Out of String Space error will occur.

**Example:**

**10 CLEAR 1000**

Makes 1000 bytes available for string storage.

By setting string storage to the exact amount needed, your program can make more efficient use of memory. A program which uses no string variables could include a CLEAR 0 statement, for example. The CLEAR argument must be non-negative, or an error will result.

### **DIM name (dim<sub>1</sub>, dim<sub>2</sub>, ..., dim<sub>K</sub>)**

Lets you set the "depth" (number of elements allowed per dimension) of an array or list of arrays. If no DIM statement is used, a depth of 11 (subscripts 0-10) is allowed for each dimension of each array used.

---

**Example:**

```
10 DIM A(5),B(2,3),C$(20)
```

Sets up a one-dimension array A with subscripted elements 0-5; a two-dimension array B with subscripted elements 0,0 to 2,3; and a one-dimension string array CS with subscripted elements 0-20. Unless previously defined otherwise, arrays A and B will contain single-precision values.

DIM statements may be placed anywhere in your program, and the depth specifier may be a number or a numerical expression.

**Example:**

```
40 INPUT "NUMBER OF NAMES";N  
50 DIM NA(N,2)
```

To re-dimension an array, you must first use a CLEAR statement,.. either with or without an argument. Otherwise an error will result.

**Example Program:**

```
10 AA(4) = 11.5  
20 DIM AA(7)
```

RUN

```
?DD ERROR IN 20
```

See Chapter 6, ARRAYS.

**LET *variable* = *expression***

May be used when assigning values to variables. RADIO SHACK LEVEL II does not require LET with assignment statements, but you might want to use it to ensure compatibility with those versions of BASIC that do require it.

**Examples:**

```
100 LET AS$="A ROSE IS A ROSE"  
110 LET B1=1.23  
120 LET X=X-Z1
```

In each case, the variable on the left side of the equals sign is assigned the value of the constant or expression on the right side.

**END**

Terminates execution normally (without a BREAK message). Some versions of BASIC require END as the last statement in a program; with LEVEL II it is optional. END is primarily used to force execution to terminate at some point other than the logical end of the program.

**Example:**

```
10 INPUT S1,S2
20 GOSUB 100
.
.
.
99 END
100 H=SQR(S1*S1 + S2*S2)
110 RETURN
```

The END statement in line 99 prevents program control from "crashing" into the subroutine. Now line 100 can only be accessed by a branching statement such as 20 GOSUB 100.

**STOP**

Interrupts execution and prints a BREAK IN *line number* message. STOP is primarily a debugging aid. During the break in execution, you can examine or change variable values. The command CONT can then be used to re-start execution at the point where it left off. (If the program itself is altered during a break, CONT cannot be used.)

**Example:**

```
10 X=RND(10)
15 STOP
20 GOSUB 1000
```

RUN

```
BREAK IN 15
READY
>—
```

Suppose we want to examine what value for X is being passed to the subroutine beginning at line 1000. During the break, we can examine X with PRINT X. (You can delete line 15 after the program is debugged.)

**GOTO *line number***

Transfers program control to the specified line number. Used alone, GOTO *line number* results in an unconditional (or automatic) branch; however, test statements may precede the GOTO to effect a conditional branch.

**Example:**

```
200 GOTO 10
When 200 is executed, control will automatically jump back to
line 10.
```

You can use GOTO in the Command Mode as an alternative to RUN. GOTO *line number* causes execution to begin at the specified line number, without an automatic CLEAR. This lets you pass values assigned in the Command Mode to variables in the Execute Mode.

See IF,THEN,ELSE,ON... GOTO.

### **GOSUB *line number***

Transfers program control to the subroutine beginning at the specified line number. When the Computer encounters a RETURN statement in the subroutine, it will then return control to the statement which follows GOSUB. GOSUB, like GOTO may be preceded by a test statement. See IF,THEN,ELSE,ON... GOSUB.

Example Program:

```
100 GOSUB 200
110 PRINT "BACK FROM SUBROUTINE": END
200 PRINT "EXECUTING THE SUBROUTINE"
210 RETURN
(RUN)
EXECUTING THE SUBROUTINE
BACK FROM THE SUBROUTINE
```

Control branches from line 100 to the subroutine beginning at line 200. Line 210 instructs Computer to return to the statement immediately following GOSUB, that is, line 110.

### **RETURN**

Ends a subroutine and returns control to statement immediately following the most recently executed GOSUB. If RETURN is encountered without execution of a matching GOSUB, an error will occur. See GOSUB.

### **ON *n* GOTO *line number*, . . . , *line number***

This is a multi-way branching statement that is controlled by a test variable or expression. The general format for ON *n* GOTO is:

**ON *expression* GOTO *1st line number*, *2nd line number*, . . . , *Kth line number***  
*expression* must be between 0 and 255 inclusive.

When ON . . . GOTO is executed, first the expression is evaluated and the integer portion . . . INT(expression) . . . is obtained. We'll refer to this integer portion as J. The Computer counts over to the Jth

element in the line-number list, and then branches to the line number specified by that element. If there is no Jth element (that is, if  $J > K$  in the general format above), then control passes to the next statement in the program.

If the test expression or number is less than zero, an error will occur. The line-number list may contain any number of items.

For example,

```
100 ON M1 GOTO 150, 160, 170, 150, 180
```

says "Evaluate M1. If integer portion of M1 equals 1 then go to line 150;  
If it equals 2, then go to 160;  
If it equals 3, then go to 170;  
If it equals 4, then go to 150;  
If it equals 5, then go to 180;  
If the integer portion of M1 doesn't equal any of the numbers 1 through 5, advance to the next statement in the program."

#### Sample Program Using ON # GOTO

```
100 INPUT "ENTER A NUMBER":X
200 ON SGN(X)+2 GOTO 220,230,240
220 PRINT "NEGATIVE":END
230 PRINT "ZERO":END
240 PRINT "POSITIVE":END
```

SGN(X) returns -1 for X less than zero; 0 for X equal to zero; and +1 for X greater than 0. By adding 2, the expression takes on the values 1, 2, and 3, depending on whether X is negative, zero, or positive. Control then branches to the appropriate line number.

#### ON $n$ GOSUB line number, . . . , line number

Works like ON  $n$  GOTO, except control branches to one of the subroutines specified by the line numbers in the line-number list.

Example:

```
100 INPUT "CHOOSE 1, 2 OR 3":I
105 ON I GOSUB 200,300,400
110 END
200 PRINT "SUBROUTINE #1":RETURN
300 PRINT "SUBROUTINE #2":RETURN
400 PRINT "SUBROUTINE #3":RETURN
```

The test object  $n$  may be a numerical constant, variable or expression. It must have a non-negative value or an error will occur.

See ON  $n$  GOTO.

---

```
FOR name = exp TO exp STEP exp  
NEXT name
```

Opens an iterative (repetitive) loop so that a sequence of program statements may be executed over and over a specified number of times. The general form is (brackets indicate optional material):

```
line # FOR counter-variable = initial value TO final value [STEP increment]  
:  
[program statements]  
line # NEXT [counter-variable]
```

In the FOR statement, *initial value*, *final value* and *increment* can be constants, variables or expressions. The first time the FOR statement is executed, these three are evaluated and the values are saved; if the variables are changed by the loop, it will have no effect on the loop's operation. However, the counter variable must not be changed or the loop will not operate normally.

The FOR-NEXT-STEP loop works as follows: the first time the FOR statement is executed, the counter is set to the "initial value." Execution proceeds until a NEXT statement is encountered. At this point, the counter is incremented by the amount specified in the STEP increment. (If the increment has a negative value, then the counter is actually decremented.) If STEP increment is not used, an increment of 1 is assumed.

Then the counter is compared with the final value specified in the FOR statement. If the counter is greater than the final value, the loop is completed and execution continues with the statement following the NEXT statement. (If increment was a negative number, loop ends when counter is less than final value.) If the counter has not yet exceeded the final value, control passes to the first statement after the FOR statement.

#### Example Programs:

```
10 FOR I=10 TO 1 STEP -1  
20 PRINT I;  
30 NEXT
```

RUN

```
10 9 8 7 6 5 4 3 2 1  
READY  
>-
```

---

```
10 FOR K=0 TO 1 STEP .3  
20 PRINT K;  
30 NEXT
```

**RUN**

.0 .3 .6 .9

**READY**

>-

After K=.9 is incremented by .3, K=1.2. This is greater than the *final value* 1, therefore loop ends without ever printing *final value*.

---

```
10 FOR = 4 TO 0
20 PRINT K;
30 NEXT
```

**RUN**

4

**READY**

>-

No STEP is specified, so STEP 1 is assumed. After K is incremented the first time, its value is 5. Since 5 is greater than the *final value* 0, the loop ends.

---

```
10 J=3 : K=8 : L=2
20 FOR I=J TO K+1 STEP L
25 J=0 : K=0 : J=0
30 PRINT I;
40 NEXT
```

**RUN**

3 5 7 9

**READY**

>-

The variables and expressions in line 20 are evaluated once and these values become constants for the FOR-NEXT-STEP loop. Changing the variable values later has no effect on the loop.

---

FOR-NEXT loops may be "nested":

```
10 FOR I=1TO3
20 PRINT "OUTER LOOP"
30   FOR J=1 TO 2
40     PRINT "  INNER LOOP"
50   NEXT J
60 NEXT I
```

**RUN**

```
OUTER LOOP
    INNER LOOP
        INNER LOOP
    OUTER LOOP
        INNER LOOP
        INNER LOOP
    OUTER LOOP
        INNER LOOP
        INNER LOOP
```

Note that each NEXT statement specifies the appropriate counter variable; however, this is just a programmer's convenience to help keep track of the nesting order. The counter variable may be omitted from the NEXT statements. But if you do use the counter variables, you must use them in the right order; i.e., the counter variable for the innermost loop must come first.

It is also advisable to specify the counter variable with NEXT statements when your program allows branching to program lines outside the FOR-NEXT loop.

Another option with nested NEXT statements is to use a counter variable list.

Delete line 50 from the above program and change line 60:

```
60  NEXT J,I
```

Loops may be nested 3-deep, 4-deep, etc. The only limit is the amount of memory available.

### **ERROR code**

Lets you "simulate" a specified error during program execution. The major use of this statement is for testing an ON ERROR GOTO routine. When the **ERROR code** statement is encountered, the Computer will proceed exactly as if that kind of error had occurred. Refer to Appendix B for a listing of error codes and their meanings.

**Example Program:**

```
100  ERROR 1
RUN
?NF  ERROR
READY
>-
```

1 is the error code for "attempt to execute NEXT statement without a matching FOR statement".

See **ON ERROR GOTO, RESUME**.

## **ON ERROR GOTO *line number***

When the Computer encounters any kind of error in your program, it normally breaks out of execution and prints an error message. With ON ERROR GOTO, you can set up an error-trapping routine which will allow your program to "recover" from an error and continue, without any break in execution. Normally you have a particular type of error in mind when you use the ON ERROR GOTO statement. For example, suppose your program performs some division operations and you have not ruled out the possibility of division by zero. You might want to write a routine to handle a division-by-zero error, and then use ON ERROR GOTO to branch to that routine when such an error occurs.

### **Example:**

```
5  ON ERROR GOTO 100
10 C = 1/0
```

In this "loaded" example, when the Computer attempts to execute line 10, a divide-by-zero error will occur. But because of line 5, the Computer will simply ignore line 10 and branch to the error-handling routine beginning at line 100.

**NOTE:** The ON ERROR GOTO must be executed before the error occurs or it will have no effect.

The ON ERROR GOTO statement can be disabled by executing an ON ERROR GOTO 0. If you use this inside an error-trapping routine, BASIC will handle the current error normally.

The error handling routine must be terminated by a RESUME statement. See RESUME.

## **RESUME *line number***

Terminates an error handling routine by specifying where normal execution is to resume.

RESUME without a line number and RESUME 0 cause the Computer to return to the statement in which the error occurred.

RESUME followed by a line number causes the Computer to branch to the specified line number.

RESUME NEXT causes the Computer to branch to the statement following the point at which the error occurred.

### **Sample Program with an Error Handling Routine**

```
5  ON ERROR GOTO 100
10 INPUT "SEEKING SQUARE ROOT OF";X
20 PRINT SQR(X)
30 GOTO 10
100 PRINT "IMAGINARY ROOT:"; SQR(-X);"-i"
110 RESUME 10
```

RUN the program and try inputting a negative value.

## **REM**

Instructs the Computer to ignore the rest of the program line. This allows you to insert comments (REMARKs) into your program for documentation. Then, when you (or someone else) look at a listing of your program, it'll be a lot easier to figure out. If REM is used in a multi-statement program line, it must be the last statement.

### **Examples Program:**

```
10 REM ** THIS REMARK INTRODUCES THE PROGRAM **
20 REM ** AND POSSIBLY THE PROGRAMMER, TOO.    **
30 REM   **
40 REM ** THIS REMARK EXPLAINS WHAT THE        **
50 REM ** VARIOUS VARIABLES REPRESENT:        **
60 REM ** C = CIRCUMFERENCE R = RADIUS        **
70 REM ** D = DIAMETER                         **
80 REM
90 INPUT "RADIUS":R : REM THIS IS FIRST EXECUTABLE LINE
```

The above program shows some of the graphic possibilities of REM statements. Any alphanumeric character may be included in a REM statement, and the maximum length is the same as that of other statements: 255 characters total.

IN LEVEL II BASIC, an apostrophe '(SHIFT 7) may be used as an abbreviation for :REM.

```
100 ' THIS TOO IS A REMARK
```

### **IF true/false expression action-clause**

Instructs the Computer to test the following logical or relational expression. If the expression is True, control will proceed to the "action" clause immediately following the expression. If the expression is False, control will jump to the matching ELSE statement (if there is one) or down to the next program line.

In numerical terms, if the expression has a non-zero value, it is always equivalent to a logical True.

### **Examples:**

```
100 IF X > 127 PRINT "OUT OF RANGE": END
```

If X is greater than 127, control will pass to the PRINT statement and then to the END statement. But if X is not greater than 127, control will jump down to the next line in the program, skipping the PRINT and END statements.

```
100 IF 0 <= X AND X < 90 THEN Y = X + 180
```

If both expressions are True then Y will be assigned the value X+180. Otherwise control will pass directly to the next program line, skipping the THEN clause.

**NOTE:** THEN is optional in the above and similar statements. However, THEN is sometimes required to eliminate an ambiguity. For example, 400 IF Y=M THEN M=0 won't work without THEN.

```
500 INPUT AS : IF AS="YES" THEN 100  
600 INPUT AS : IF AS="YES" GOTO 100
```

The two statements have the same effect. THEN is not optional in line 500 and other IF *expression* THEN *line number* statements.

```
100 IF A>0 AND B>0 PRINT "BOTH POSITIVE"
```

The test expression may be composed of several relational expressions joined by logical operators AND and OR.

See THEN, ELSE.

### **THEN statement or line number**

Initiates the "action clause" of an IF-THEN type statement. THEN is optional except when it is used to specify a branch to another line number, as in IF A<0 THEN 100. THEN should also be used in IF-THEN-ELSE statements.

### **ELSE statement or line number**

Used after IF to specify an alternative action in case the IF test fails. (When no ELSE statement is used, control falls through to the next program line after a test fails.)

Examples:

```
100 INPUT AS : IF AS="YES" THEN 300 ELSE END
```

In line 100, if AS equals "YES" then the program branches to line 300. But if AS does not equal "YES", program skips over to the ELSE statement which then instructs the Computer to end execution.

```
200 IF A<B PRINT "A<B" ELSE PRINT "B<=A"
```

If A is less than B, the Computer prints that fact, and then proceeds down to the next program line, skipping the ELSE statement. If A is not less than B, Computer jumps directly to the ELSE statement and prints the specified message. Then control passes to the next statement in the program.

```
200 IF A>.001 THEN B=1/A : A = A/5 : ELSE 260
```

If A >.001 is True, then the next two statements will be executed, assigning new values to B and A. Then the program will drop down to the next line, skipping the ELSE statement. But if A >.001 is

False, the program jumps directly over to the ELSE statement, which then instructs it to branch to line 280. Note that GOTO is not required after ELSE.

IF-THEN-ELSE statements may be nested, but you have to take care to match up the IFs and ELSEs.

```
10 INPUT "ENTER TWO NUMBERS";A,B
20 IF A < =B THEN IF A < B PRINT A::ELSE PRINT "NEITHER)::ELSE PRINT B;
30 PRINT "IS SMALLER"
```

RUN the program, inputting various pairs of numbers. The program picks out and prints the smaller of any two numbers you enter. Note that the THEN statements and the colons may be omitted from line 20.

## Data Conversion

Every number used during execution must be typed as either integer, single precision or double precision. Often this typing involves converting a number from one form to another. This may produce unexpected, confusing results -- unless you understand the rules governing such automatic typing and type conversion.

## Type Conversion

Constants are the actual numbers (not the variable names) used by LEVEL II BASIC during execution. They may appear in your program (as in X=1/3, the right side of the equation) or they may be temporary (intermediate) constants created during the evaluation of an expression. In any case, the following rules determine how a constant is typed:

- I. If a constant contains 8 or more digits, or if D is used in the exponent, that number is stored as double precision. Adding a # declaration character also forces a constant to be stored as double precision.
- II. If the number is not double-precision, and if it is outside the range -32768 to +32767 or if it contains a decimal point, then the number is stored as single-precision. If number is expressed in exponential notation with E preceding the exponent, the number is single precision.
- III. If neither I nor II is true of the constant, then it is stored as an integer.

### Example Program:

```
10 PRINT 1.234567, 1.2345678
RUN
```

```
1.23457      1.2345678
READY
>-
```

---

---

The first constant contains 7 digits; so by Rules I and II, it becomes a single-precision number. Single precision numbers are printed as 6 digits with the least significant digit properly rounded. But the second constant contains 8 digits, therefore by Rule I it becomes a double precision number, stored internally as 1.234567800000000. The number is printed out with all eight significant digits showing, and all the trailing zeros suppressed.

## Typing of Constants

When operations are performed on one or two numbers, the result must be typed as integer, double or single-precision.

When a +, -, or \* operation is performed, the result will have the same degree of precision as the most precise operand. For example, if one operand is single-precision, and the other double-precision, the result will be double precision. Only when both operands are integers will a result be integer. If the result of an integer \*, -, or + operation is outside the integer range, the operation will be done in single precision and the result stored as single precision.

Division follows the same rules as +, \* and -, except that it is never done at the integer level: when both operators are integers, the operation is done in single precision with a single-precision result.

During a compare operation (<, >, =, etc.) the operands are converted to the same type before they are compared. The less precise type will always be converted to the more precise type.

If you are using logical operators for bit manipulations or Boolean operations (see Chapter 8, "Logical Operators"), you'll need to read the next paragraph; otherwise, skip it.

The logical operators AND, OR and NOT first convert their operands to integer form. If one of the operands is outside the allowable range for integers (-32768 to +32767) an overflow error occurs. The result of a logical operation is always an integer.

## Effects of Type Conversions on Accuracy

When a number is converted to integer type, it is "rounded down"; i.e., the largest integer which is not greater than the number is used. (This is the same thing that happens when the INT function is applied to the number.)

When a number is converted from double to single precision, it is "4/5 rounded" (the least significant digit is rounded up if the fractional part  $>= .5$ . Otherwise it is left unchanged).

In the following examples, keep in mind that single precision variables are stored with 7 digits of precision, but printed out with 6 digits (to allow for proper rounding). Similarly, double precision values are stored with 17 digits but printed out with only 16.

**Example Programs:**

```
10 A#=1.666666666666667
20 B1=A#
30 C%=A#
40 PRINT B1,C%
RUN

1.66667      1
READY
>—
```

When a single precision number is converted to double precision, only the seven most significant digits will be accurate. And if the single precision number didn't contain seven significant digits, watch out!

**Examples:**

```
10 A1=1.3
20 A#=A1
30 PRINT A#
RUN

1.29999952316284
READY
>—
```

```
-----  
10 A#=2/3
20 PRINT A#
RUN

.666666865348816
READY
>—
```

2/3 is converted to a single precision constant; therefore only the first seven digits of A# are accurate.

```
-----
```

```
10 A#=2/3#
20 PRINT A#
RUN

.6666666666666667
READY
>—
```

Since the expression  $2/3\#$  is evaluated as a double precision constant, all 16 digits of A# are accurate, with the least significant properly 4/5- rounded.

When assigning a constant value to a double precision variable, be sure to include as many significant digits as possible (up to 17). If your constant has seven or less significant digits, you might as well use single precision.

**Examples:**

```
10 PI#=3.1415926535897932
20 E#=2.7182818284590432
```

## 5/Strings

"Without string-handling capabilities, a computer is just a super-powered calculator." There's an element of truth in that exaggeration; the more you use the string capabilities of LEVEL II, the truer the statement will seem.

LEVEL I BASIC offered two string variables which could be input and output to make your programs look "friendly" (as in **HELLO, BOB!**). In LEVEL II you can do much more than that. First of all, you're not limited to two strings — any valid variable name can be used to contain string values, by the DEFSTR statement or by adding a type declaration character to the name. And each string can contain up to 255 characters.

Moreover, you can compare strings in LEVEL II, to alphabetize them, for example. You can take strings apart and string them together (concatenate them). For background material to this chapter, see Chapter 1, "Variable Types" and "Glossary", and Chapter 4, DEFSTR.

Subjects and functions covered in this chapter:

"String Input/Output"	FRE (string)	MIDS
"String Comparisons"	INKEY\$	RIGHT\$
"String Operations"	LEN	STR\$
ASC	LEFT\$	STRINGS
CHR\$		VAL
		INSTRING Subroutine

### String Input/Output

String constants — sequences of alphanumeric characters — may be input to a program just as numeric constants are input, using INPUT, READ/DATA, and INPUT # (input from cassette). They may generally be input without quotes:

```
10 INPUT "YES OR NO":RS
20 IF RS="YES"PRINT "THAT'S BEING POSITIVE!":END
30 PRINT "WHY NOT?"

RUN
YES OR NO?_[you type] YES ENTER
THAT'S BEING POSITIVE!
READY
>-
```

However, to input a string constant which contains commas, colons, or leading blanks, the string must be enclosed in quotes.

```
10 INPUT "LAST NAME, FIRST NAME":NS
20 PRINT NS
RUN
LAST NAME, FIRST NAME? ... [you type:] "SMITH, JOHN"
ENTER
SMITH, JOHN
READY
> -
```

The same rule regarding commas, colons and leading blanks applies to values input via DATA statements and INPUT # statements.

```
10 READ TS, NS, DS
20 PRINT TS;NS;DS
30 DATA "TOTAL IS: ","ONE THOUSAND, TWO HUNDRED "
40 DATA DOLLARS.
```

TS requires quotes because of the colon;  
NS requires quotes because of the comma.

## String Comparisons

Strings may be compared for equality or alphabetic precedence. When they are checked for equality, every character, including any leading or trailing blanks, must be the same or the test fails.

```
600 IF Z$="END" THEN 999
```

Strings are compared character-for-character from left to right. Actually the ASCII codes for the characters are compared, and the character with the lower code number is considered to precede the other character. (See Appendix C, ASCII Codes.)

For example, the constant "A!" precedes the constant "A#", because "!" (ASCII code: decimal 33) precedes "#" (ASCII code: decimal 35). When strings of differing lengths are compared, the shorter string is precedent if its characters are the same as those in the longer string. For example, "A" precedes "A ".

The following relational symbols may be used to compare strings;

=      <>      <      <=      >      >=

Note: Whenever a string constant is used in a comparison expression or an assignment statement, the constant must be enclosed in quotes:

```
AS$="CONSTANT"
IF AS$="CONSTANT" PRINT AS$
(The quotes are required in both cases.)
```

## String Operations

Not including the functions described below, there is only one string operation – concatenation, represented by the plus symbol +.

Example Programs:

```
10 CLEAR 75
20 AS="A ROSE"
30 BS=" IS A ROSE"
40 CS=AS+BS+B$+"."
50 PRINT CS
```

RUN

```
A ROSE IS A ROSE IS A ROSE IS A ROSE.
READY
>—
```

In line 40, the strings are concatenated – strung together.

```
10 TS="100"
20 SUB$="5"
30 CODE$="32L"
40 LCS=TS+"."+SUB$+CODE$
50 PRINT LCS
```

RUN

```
100.532L
READY
>—
```

### ASC (string)

Returns the ASCII code (in decimal form) for the first character of the specified string. The string-argument must be enclosed in parentheses. A null-string argument will cause an error to occur.

```
100 PRINT ASC("A")
110 TS="AB": PRINT ASC(T$)
```

Lines 100 and 110 will print the same number.

The argument may be an expression involving string operators and functions:

```
200 PRINT ASC(RIGHT$(TS,1))
```

Refer to the ASCII Code Table, Appendix C. Note that the ASCII code for a lower-case letter is equal to that letter's upper-case ASCII code plus 31. So ASC may be used to convert upper-case values to

---

lower-case values — useful in case you have a line printer with lower-case capabilities and the proper interfacing hardware/software).

ASC may also be used to create coding/decoding procedures (see example at end of this chapter).

### **CHR\$ (expression)**

Performs the inverse of the ASC function: returns a one-character string whose character has the specified ASCII, control or graphics code. The argument may be any number from 0 to 255, or any variable expression with a value in that range. Argument must be enclosed in parentheses.

**100 PRINT CHR\$(35)                    prints a pound-sign #**

Using CHR\$, you can even assign quote-marks (normally used as string-delimiters) to strings. The ASCII code for quotes " is 34. So A\$=CHR\$(34) assigns the value " to A\$.

```
100 A$=CHR$(34)  
110 PRINT"HE SAID, ";A$;"HELLO.";A$
```

**RUN**

```
HE SAID, "HELLO."  
READY  
>—
```

CHR\$ may also be used to display any of the 64 graphics characters. (See Appendix C, Graphics Codes.)

```
10 CLS  
20 FOR I=129 TO 191  
30 PRINT I:CHR$(I).  
40 NEXT  
50 GOTO 50
```

(RUN the program to see the various graphics characters.)

Codes 0-31 are display control codes. Instead of returning an actual display character, they return a control character. When the control character is PRINTed, the function is performed. For example, 23 is the code for 32 character-per-line format; so the command, PRINT CHR\$(23) converts the display format to 32 characters per line. (Hit CLEAR, or execute CLS, to return to 64 character-per-line format.)

## **FRE (string)**

When used with a string variable or string constant as an argument, returns the amount of string storage space currently available.

Argument must be enclosed in parentheses.

```
500 PRINT FRE(A$), FRE(L$), FRE("Z")
```

All return the same value.

The string used has no significance; it is a dummy variable. See Chapter 4, CLEAR n.

## **INKEY\$**

Returns a one-character string determined by an instantaneous keyboard strobe. If no key is pressed during the strobe, a null string (length zero) is returned. This is a very powerful function because it lets you input values while the Computer is executing — without using the **ENTER** key. The popular video games which let you fire at will, guide a moving dot through a maze, play tennis, etc., may all be simulated using the INKEY\$ function (plus a lot of other program logic, of course).

Characters typed to an INKEYS are not automatically displayed on the screen.

Because of the short duration of the strobe cycle (on the order of microseconds) INKEYS is invariably placed inside some sort of loop, so that the Keyboard is scanned repeatedly.

### **Example Program:**

```
10  CLS
100 PRINT @ 540,INKEY$ : GOTO 100
```

RUN the program; notice that the screen remains blank until the first time you hit a key. The last key hit remains on the screen until you hit another one. (Whenever you fail to hit a key during a keyboard strobe, a null string, i.e., "nothing", is PRINTed at 540. This "nothing" has no effect on the currently displayed character at 540.)

INKEY\$ may be used in sequences of loops to allow the user to build up a longer string.

### **Example:**

```
90  PRINT "ENTER THREE CHARACTERS"
100 A$=INKEY$ : IF A$="" THEN 100 ELSE PRINT A$;
110 B$=INKEY$ : IF B$="" THEN 110 ELSE PRINT B$;
120 C$=INKEY$ : IF C$="" THEN 120 ELSE PRINT C$;
130 DS=A$+B$+C$
```

A three-character string DS can now be entered via the keyboard without using the **ENTER** key.

NOTE: The statement IF A\$="" compares A\$ to the null string.

### **LEFT\$ (string, n)**

Returns the first *n* characters of *string*. The arguments must be enclosed in quotes. *string* may be a string constant or expression, and *n* may be a numeric expression.

**Example Program:**

```
10 AS="TIMOTHY"  
20 BS=LEFT$(AS,3)  
30 PRINTBS;"-THAT'S SHORT FOR ";AS
```

RUN

```
TIM-THAT'S SHORT FOR TIMOTHY  
READY  
>—
```

### **LEN (string)**

Returns the character length of the specified string. The string variable, expression, or constant must be enclosed in parentheses.

```
10 AS=""  
20 BS="TOM"  
30 PRINT AS,BS,BS+BS  
40 PRINT LEN(AS),LEN(BS),LEN(BS+BS)
```

RUN

	TOM	TOMTOM
0	3	6
READY		
>—		

### **MID\$ (string,p,n)**

Returns a substring of *string* with length *n* and starting at position *p*. The string name, length and starting position must be enclosed in parentheses. *string* may be a string constant or expression, and *n* and *p* may be numeric expressions or constants. For example, **MIDS(LS,3,1)** refers to a one-character string beginning with the 3rd character of LS.

**Example Program:**

The first three digits of a local phone number are sometimes called the "exchange" of the number. This program looks at a complete phone number (area code, exchange, last four digits) and picks out the exchange of that number.

```
10 INPUT "AREA CODE AND NUMBERS (NO HYPHENS, PLEASE)":PHS  
20 EXS=MIDS(PHS, 4, 3)  
30 PRINT "NUMBER IS IN THE ";EXS;" EXCHANGE."
```

---

If no argument is specified for the length *n*, the entire string beginning at position *p* is returned.

### **RIGHT\$ (string, *n*)**

Returns the last *n* characters of *string*. *string* and *n* must be enclosed in parentheses. *string* may be a string constant or variable, and *n* may be a numerical constant or variable. If LEN(*string*) is less than or equal to *n*, the entire *string* is returned.

RIGHTS(STS,4) returns the last 4 characters of STS.

### **STR\$ (expression)**

Converts a numeric expression or constant to a string. The numeric expression or constant must be enclosed in parentheses. STRS(A), for example, returns a string equal to the character representation of the value of A. For example, if A=58.5, then STRS(A) equals the string " 58.5". (Note that a leading blank is inserted before "58.5" to allow for the sign of A). While arithmetic operations may be performed on A, only string operations and functions may be performed on the string "58.5".

PRINT STRS(X) prints X without a trailing blank; PRINT X prints X with a trailing blank.

#### **Example Program:**

```
10 A=58.5 : B=-58.5
20 PRINT STRS(A)
30 PRINT STRS(B)
40 PRINT STRS(A+B)
50 PRINT STRS(A)+STRS(B)
```

#### **RUN**

```
58.5
-58.5
0
58.5-58.5
READY
>-
```

Note that the leading blank is filled by the minus sign in STRS(B).

### **STRING\$ (*n*, *character* or *number*)**

Returns a string composed of *n* *character*-symbols. For example, STRING\$(30,"\*") returns "\*\*\*\*\*q\*\*\*\*\*". STRING\$ is useful in creating graphs, tables, etc.

*character* can also be a number from 0-255; in this case, it will be treated as an ASCII, control, or graphics code.

---

---

**Example:**

STRINGS(64,191) returns a string composed of 64 graphics blocks.

**VAL (string)**

Performs the inverse of the STRS function; returns the number represented by the characters in a string argument. For example, if AS="12" and BS="34" then VAL(AS+BS) returns the value 12.34. VAL(AS+E+BS) returns the value 12E34, that is  $12 \times 10^{34}$ .

VAL operates a little differently on mixed strings – strings whose values consist of a number followed by alphanumeric characters. In such cases, only the leading number is used in determining VAL; the alphanumeric remainder is ignored.

For example: VAL ("100 DOLLARS") returns 100.

This can be a handy short-cut in examining addresses, for example.

**Example Program:**

```
10 REM "WHAT SIDE OF THE STREET?"  
15 REM EVEN=NORTH, ODD=SOUTH  
20 INPUT "ADDRESS: NUMBER AND STREET": ADS$  
30 C=INT(VAL(ADS$)/2)*2  
40 IF C>VAL(ADS$) PRINT "NORTH SIDE": GOTO 20  
50 PRINT "SOUTH SIDE": GOTO 20
```

RUN the program, entering street addresses like "1015 SEVENTH AVE".

## Coding/Decoding Program for Illustration Only

```
5 CLS: PRINT CHR$(23)  
10 CLEAR 1000  
20 INPUT "ENTER MESSAGE": MS$  
30 FOR K=1 TO LEN(MS$)  
40 TS=MIDS(MS$, K, 1)  
50 CD=ASC(TS)-5: IF CD>255 CD=CD-255  
70 NUS=NUS + CHR$(CD)  
80 NEXT  
90 PRINT "THE CODED MESSAGE IS"  
100 PRINT NUS  
110 FOR K=1 TO LEN(NUS)  
120 TS=MIDS(NUS, K, 1)  
130 CD=ASC(TS)+5: IF CD<0 CD=CD+255  
140 OLDS=OLDS+CHR$(CD)  
150 NEXT  
160 PRINT "THE DECODED MESSAGE IS"  
170 PRINT OLDS
```

RUN the program.

---

---

Lines 30-80 and 110-150 demonstrate how you can "peel off" the characters of a string for examination. Lines 60 and 130 demonstrate manipulation of ASCII codes.

### Instring Subroutine

Using the intrinsic string functions MID\$ and LEN, it's easy to create a very handy string-handling subroutine, INSTRING. This function takes two string arguments and tests to see whether one is contained in the other. When you are searching for a particular word, phrase or piece of data in a larger body of text or data, INSTRING can be very powerful. Here's the subroutine:

```
999  END ' THIS IS A PROTECTIVE END-BLOCK
1000 FOR I=1 TO LEN(X$)-LEN(Y$)+1
1010 IF Y$=MID$(X$,I,LEN(Y$)) RETURN
1020 NEXT : I=0 : RETURN
```

To use the subroutine, first assign the value of the larger string (the "search area") to XS, and the value of the desired substring to Y\$. Then call the subroutine with GOSUB. The subroutine will return a value of I which tells you the starting position of Y\$ in the larger string XS; or if Y\$ is not a substring of XS, I is returned with a value of zero.

Here's a sample program using the INSTRING subroutine. (Type in the above lines 999-1020 plus the following.)

```
5  CLEAR 1000 : CLS
10 INPUT "ENTER THE LONGER STRING": XS
20 INPUT "NOW ENTER THE SHORTER STRING": Y$
30 GOSUB 1000
40 IF I=0 THEN 70
50 PRINT Y$;" IS A SUBSTRING OF ";XS
55 PRINT "STARTING POSITION:";I,
60 PRINT "ENDING POSITION:";I+LEN(Y$)-1
65 PRINT : PRINT : GOTO 10
70 PRINT Y$;" IS NOT CONTAINED IN ";XS
80 GOTO 10
```

RUN the program, entering the string to be searched and then the desired substring.

## 6/Arrays

An array is simply an ordered list of values. In LEVEL II these values may be either numbers or strings, depending on how the array is defined or typed. Arrays provide a fast and organized way of handling large amounts of data. To illustrate the power of arrays, this chapter traces the development of an array to store checkbook data: check numbers, dates written, and amounts for each check.

In addition, several matrix manipulation subroutines are listed at the end of this chapter. These sequences will let you add, multiply, transpose, and perform other operations on arrays.

**Note:** Throughout this chapter, zero-subscripted elements are generally ignored for the sake of simplicity. But you should remember they are available and should be used for the most efficient use of memory. For example, after DIM A(4), array A contains 5 elements: A(0), A(1), A(2), A(3), A(4).

For background information on arrays, see Chapter 4, DIM, and Chapter 1, "Arrays".

### A Check-Book Array

Consider the following table of checkbook information:

Check #	Date Written	Amount
025	1-1-73	10.00
026	1-5-73	39.95
027	1-7-73	23.50
028	1-7-73	149.50
029	1-10-78	4.90
030	1-15-78	12.49

Note that every item in the table may be specified simply by reference to two numbers: the row number and the column number. For example, (row 3, column 3) refers to the amount 23.50. Thus the number pair (3,3) may be called the "subscript address" of the value 23.50.

Let's set up an array, CK, to correspond to the checkbook information table. Since the table contains 6 rows and 3 columns, array CK will need two dimensions: one for row numbers, and one for column numbers. We can picture the array like this:

A(1,1)=025	A(1,2)=1.0178	A(1,3)=10.00
.	.	.
.	.	.
.	.	.
A(6,1)=030	A(6,2)=1.1578	A(6,3)=12.49

Notice that the date information is recorded in the form *mm.ddyy*, where *mm*=month number, *dd*=day of month, and *yy*=last two digits of year. Since CK is a numeric array, we can't store the data with alpha-numeric characters such as dashes.

Suppose we assign the appropriate values to the array elements. Unless we have used a DIM statement, the Computer will assume that our array requires a depth of 10 for each dimension. That is, the Computer will set aside memory locations to hold CK(7,1), CK(7,2), ..., CK(9,1), CK(9,2) and CK(9,3). In this case, we don't want to set aside this much space, so we use the DIM statement at the beginning of our program:

```
10 DIM CK(6,3) 'SET UP A 6 BY 3 ARRAY (EXCL. ZERO SUBSCRIPTS)
```

Now let's add program steps to read the values into the array CK:

```
20 FOR ROW=1 TO 6
30   FOR COL=1 TO 3
40     READ CK(ROW,COL)
50 NEXT COL, ROW
60 DATA 025, 1.0178, 10.00
70 DATA 026, 1.0578, 39.95
80 DATA 027, 1.0778, 23.50
90 DATA 028, 1.0778, 149.50
91 DATA 029, 1.1078, 4.90
92 DATA 030, 1.1578, 12.49
```

Now that our array is set up, we can begin taking advantage of its built-in structure. For example, suppose we want to add up all the checks written. Add the following lines to the program:

```
100 FOR ROW=1 TO 6
110   SUM=SUM+CK(ROW,3)
120 NEXT
130 PRINT "TOTAL OF CHECKS WRITTEN";
140 PRINT USING "$$##.##";SUM
```

Now let's add program steps to print out all checks that were written on a given day.

```
200 PRINT "SEEKING CHECKS WRITTEN ON WHAT DATE (MM.DDYY)";  
210 INPUT DT  
230 PRINT :PRINT "ANY CHECKS WRITTEN ARE LISTED BELOW:"  
240 PRINT "CHECK #", "AMOUNT": PRINT  
250 FOR ROW=1 TO 6  
260 IF CK(ROW,2)=DT PRINT CK(ROW,1), CK(ROW,3)  
270 NEXT
```

It's easy to generalize our program to handle checkbook information for all 12 months and for years other than 1978.

All we do is increase the size (or "depth") of each dimension as needed. Let's assume our checkbook includes check numbers 001 through 300, and we want to store the entire checkbook record. Just make these changes:

```
10 DIM CK(300,3) 'SET UP A 300 BY 3 ARRAY  
20 FOR ROW=1 TO 300
```

and add DATA lines for check numbers 001 through 300. You'd probably want to pack more data onto each DATA line than we did in the above DATA lines.

And you'd change all the ROW counter final values:

```
100 FOR ROW=1 TO 300  
.  
. .  
250 FOR ROW=1 TO 300
```

## Other Types of Arrays

Remember, in LEVEL II the number of dimensions an array can have (and the size or depth of the array), is limited only by the amount of memory available. Also remember that string arrays can be used. For example, CS(X) would automatically be interpreted as a string array. And if you use DEFSTR A at the beginning of your program, any array whose name begins with A would also be a string array. One obvious application for a string array would be to store text material for access by a string manipulation program.

```
10 CLEAR 1200  
20 DIM TXTS(10)
```

would set up a string array capable of storing 10 lines of text. 1200 bytes were CLEARED to allow for 10 sixty-character lines, plus 600 extra bytes for string manipulation with other string variables.

## Array/Matrix Manipulation Subroutines

To use this subroutine, your main program must supply values for N1 (rows) and N2 (columns).

```
30100 REM MATRIX INPUT SUBROUTINE (2 DIMENSION)
30110 FOR I=1 TO N1
30120 PRINT "INPUT ROW":I
30130 FOR J=1 TO N2
30140 INPUT A(I,J)
30160 NEXT J,I
30170 RETURN
```

To use this subroutine, your main program must supply values for N1 (dim#1), N2 (dim#2) and N3(dim#3).

```
30200 REM MATRIX READ SUBROUTINE (3 DIMENSION)
30205 REM REQUIRES DATA STMTS.
30210 FOR K=1 TO N3
30220 FOR I=1 TO N1
30230 FOR J=1 TO N2
30240 READ A(I,J,K)
30270 NEXT J,I,K
30280 RETURN
```

Main program supplies values for N1, N2, N3, etc.

```
30300 REM MATRIX ZERO SUBROUTINE (3 DIMENSION)
30310 FOR K=1 TO N3
30320 FOR J=1 TO N2
30330 FOR I=1 TO N1
30340 A(I,J,K)=0
30370 NEXT I,J,K
30380 RETURN
```

Main program supplies values for N1, N2, N3.

```
30400 REM MATRIX PRINT SUBROUTINE (3 DIMENSION)
30410 FOR K=1 TO N3
30420 FOR I=1 TO N1
30430 FOR J=1 TO N2
30440 PRINT A(I,J,K),
30450 NEXT J:PRINT
30460 NEXT I:PRINT
30470 NEXT K:PRINT
30480 RETURN
```

Main program supplies values for N1, N2, N3.

```
30500 REM MATRIX INPUT SUBROUTINE (3 DIMENSION)
30510 FOR K=1 TO N3
30520 PRINT "PAGE",K
30530 FOR I=1 TO N1
30540 PRINT "INPUT ROW":I
30550 FOR J=1 TO N2
30560 INPUT A(I,J,K)
30570 NEXT J
30580 NEXT I
30590 PRINT:NEXT K
30595 RETURN
```

Multiplication by a Single Variable: Scalar Multiplication (3 Dimensional)

```
30600 FOR K=1 TO N3:'N3=3RD DIMENSION
30610 FOR J=1 TO N2:'N2=2ND DIMENSION (ROWS)
30620 FOR I=1 TO N1:'N1=1ST DIMENSION (ROWS)
30630 B(I,J,K)=A(I,J,K)*X
30640 NEXT I
30650 NEXT J
30660 NEXT K
30670 RETURN
```

Multiplies each element in MATRIX A by X and constructs matrix B

Transposition of a Matrix (2 Dimensional)

```
30700 FOR I = 1 TO N1
30710 FOR J=1 TO N2
30720 B(J,I)=A(I,J)
30730 NEXT J
30740 NEXT I
30750 RETURN
```

Transpose matrix A into matrix B

Matrix Addition (3 Dimensional)

```
30800 FOR K=1 TO N3
30810 FOR J = 1 TO N2
30820 FOR I=1 TO N1
30830 C(I,J,K)=A(I,J,K)+B(I,J,K)
30840 NEXT I
30850 NEXT J
30860 NEXT K
30870 RETURN
```

#### Array Element-wise Multiplication (3 Dimensional)

```
30900 FOR K= 1 TO N3  
30910   FOR J=1 TO N2  
30920     FOR I=1 TO N1  
30930       C(I,J,K)=A(I,J,K)*B(I,J,K)  
30940     NEXT I  
30950   NEXT J  
30960 NEXT K
```

Multiples each element in A times its corresponding element in B.

---

#### Matrix Multiplication (2 Dimensional)

```
40000 FOR I=1 TO N1  
40010   FOR J=1 TO N2  
40020     C(I,J)=0  
40030     FOR K=1 TO N3  
40040       C(I,J)=C(I,J)+A(I,K)*B(K,I)  
40050     NEXT K  
40060   NEXT J  
40070 NEXT I
```

A must be an N1 by N3 matrix; B must be an N3 by N2 matrix. The resultant matrix C will be an N1 by N2 matrix. A, B, and C must be dimensioned accordingly.

## 7/Arithmetic Functions

LEVEL II BASIC offers a wide variety of intrinsic ("built-in") functions for performing arithmetic and special operations. The special-operation functions are described in the next chapter.

All the common math functions described in this chapter return single-precision values accurate to six decimal places. ABS, FIX and INT return values whose precision depends on the precision of the argument. The conversion functions (CINT, CDBL, etc.) return values whose precision depends on the particular function. For all the functions, the argument must be enclosed in parentheses. The argument may be either a numeric variable, expression or constant.

Functions described in this chapter:

<b>ABS</b>	<b>COS</b>	<b>INT</b>	<b>SGN</b>
<b>ATN</b>	<b>COSG</b>	<b>LOG</b>	<b>SIN</b>
<b>CDBL</b>	<b>EXP</b>	<b>RANDOM</b>	<b>SQR</b>
<b>CINT</b>	<b>FIX</b>	<b>RND</b>	<b>TAN</b>

### **ABS (x)**

Returns the absolute value of the argument. ABS(X)=X for X greater than or equal to zero, and ABS(X)=-X for X less than zero.

```
100 IF ABS(X)<1E-6 PRINT "TOO SMALL"
```

### **ATN (x)**

Returns the arctangent (in radians) of the argument; that is, ATN(X) returns "the angle whose tangent is X". To get arctangent in degrees, multiply ATN(X) by 57.29578.

```
100 Y=ATN(B/C)
```

### **CDBL (x)**

Returns a double-precision representation of the argument. The value returned will contain 17 digits, but only the digits contained in the argument will be significant.

CDBL may be useful when you want to force an operation to be done in double-precision, even though the operands are single precision or even integers. For example CDBL(I%)/J% will return a fraction with 17 digits of precision.

```
100 FOR I%=1 TO 25 : PRINT 1/CDBL(I%) : NEXT
```

### **CINT (x)**

Returns the largest integer not greater than the argument. For example, CINT(1.5) returns 1; CINT(-1.5) returns -2. For the CINT function, the argument must be in the range -32768 to + 32767.

CINT might be used to speed up an operation involving single or double-precision operands without losing the precision of the operands (assuming you're only interested in an integer result).

```
100 K#=CINT(X#)+CINT(Y#)
```

### **COS (x)**

Returns the cosine of the argument (argument must be in radians). To obtain the cosine of X when X is in degrees, use COS(X\*.0174533).

```
100 Y=COS(X+3.3)
```

### **CSNG (x)**

Returns a single-precision representation of the argument. When the argument is a double-precision value, it is returned as six significant digits with "4/5 rounding" in the least significant digit. So CSNG(.6666666666666667) is returned as .666667; CSNG(.3333333333333333) is returned as .333333.

```
100 PRINT CSNG(A#+B#)
```

### **EXP (x)**

Returns the "natural exponential" of X, that is,  $e^X$ . This is the inverse of the LOG function, so  $X=EXP(LOG(X))$ .

```
100 PRINT EXP(-X)
```

### **FIX (x)**

Returns a truncated representation of the argument. All digits to the right of the decimal point are simply chopped off, so the resultant value is an integer. For non-negative X, FIX(X)=INT(X). For negative values of X, FIX(X)=INT(X)+1. For example, FIX(2.2) returns 2, and FIX(-2.2) returns -2.

```
100 Y=ABS(A-FIX(A))
```

This statement gives Y the value of the fractional portion of A.

**Page Was  
Blank When  
Provided**

## **INT(x)**

Returns an integer representation of the argument, using the largest integer that is not greater than the argument. Argument is not limited to the range -32768 to +32767. INT(2.5) returns 2; INT(-2.5) returns -3; and INT(1000101.23) returns 100101.

```
100 Z=INT(A*100+.5)/100
```

Gives Z the value of A rounded to two decimal places (for non-negative A).

## **LOG(x)**

Returns the natural logarithm of the argument, that is,  $\log_e(\text{argument})$ . This is the inverse of the EXP function, so X=LOG(EXP(X)). To find the logarithm of a number to another base b, use the formula  $\log_b(X) = \log_e(X)/\log_e(b)$ . For example, LOG(32767)/LOG(2) returns the logarithm to base 2 of 32767.

```
100 PRINT LOG(3.3*X)
```

## **RANDOM**

RANDOM is actually a complete statement rather than a function. It reseeds the random number generator. If a program uses the RND function, you may want to put RANDOM at the beginning of the program. This will ensure that you get an unpredictable sequence of pseudo-random numbers each time you turn on the Computer, load the program, and run it.

```
10 RANDOM
20 C=RND(6)+RND(6)
.
.
80 GOTO 20 'RANDOM NEEDS TO EXECUTE JUST ONCE
```

## **RND(x)**

Generates a pseudo-random number using the current pseudo-random "seed number" (generated internally and not accessible to user). RND may be used to produce random numbers between 0 and 1, or random integers greater than 0, depending on the argument.

RND(0) returns a single-precision value between 0 and 1. RND(*integer*) returns an integer between 1 and *integer* inclusive (*integer* must be positive and less than 32768). For example, RND(55) returns a pseudo-random integer greater than zero and less than 56. RND(55.5) returns a number in the same range, because RND uses the INTEGER value of the argument.

```
100 X=RND(2) : ON X GOTO 200,300
```

### **SGN(x)**

The "sign" function : returns -1 for X negative, 0 for X zero, and +1 for X positive.

```
100 ON SGN(X)+2 GOTO 200,300,400
```

### **SIN(x)**

Returns the sine of the argument (argument must be in radians).  
To obtain the sine of X when X is in degrees, use SIN(X\*.0174533).

```
100 PRINT SIN(A*B-B)
```

### **SQR(x)**

Returns the square root of the argument. SQR(X) is the same as  $X^{1/2}$ , only faster.

```
100 Y=SQR(X^2-H^2)
```

### **TAN(x)**

Returns the tangent of the argument (argument must be in radians).  
To obtain the tangent of X when X is in degrees, use TAN(X\*.0174533).

```
100 Z=TAN(2*A)
```

NOTE: A great many other functions may be created using the above functions. See Appendix F, "Derived Functions".

## 8/Special Features

LEVEL II BASIC offers some unusual functions and operations that deserve special highlighting. Some may seem highly specialized; as you learn more about programming and begin to experiment with machine-language routines, they will take on more significance. Other functions in the chapter are of obvious benefit and will be used often (for example, the graphics functions). And then there are a couple of features, INP and OUT, that will be used primarily with the TRS-80 Expansion Interface.

Functions, statements and operators described in this chapter:

Graphics:	Error-Routine Functions:	Other Functions and Statements:
SET	ERL	INP
RESET	ERR	MEM
CLS		PEEK
POINT	Logical Operators:	POKE
	AND	POS
	OR	OUT
	NOT	USR
		VARPTR

### SET(*x,y*)

Turns on the graphics block at the location specified by the coordinates *x* and *y*. For graphics purposes, the Display is divided up into a 128 (horizontal) by 48 (vertical) grid. The *x*-coordinates are numbered from left to right, 0 to 127. The *y*-coordinates are numbered from top to bottom, 0 to 47. Therefore the point at (0,0) is in the extreme upper left of the Display, while the point at (127,47) is in the extreme lower right corner. See the Video Display Worksheet in Appendix E.

The arguments *x* and *y* may be numeric constants, variables or expressions. They need not be integer values, because SET(*x,y*) uses the INTeger portion of *x* and *y*. SET (*x,y*) is valid for:

0 <= *x* < 128  
0 <= *y* < 48

#### Examples:

```
100 SET(RND(128)-1,RND(48)-1)  
Lights up a random point on the Display.
```

```
100 INPUT X,Y: SET(X,Y)  
RUN to see where the blocks are.
```

## **RESET(x,y)**

Turns off a graphics block at the location specified by the coordinates *x* and *y*. This function has the same limits and parameters as SET(*x,y*).

```
200 RESET (X,3)
```

## **CLS**

"Clear-Screen" – turns off all the graphics blocks on the Display and moves the cursor to the upper left corner. This wipes out alphanumeric characters as well as graphics blocks. CLS is very useful whenever you want to present an attractive Display output.

```
5   CLS
10  SET(RND(128)-1,RND(48)-1)
20  GOTO 10
```

## **POINT(x,y)**

Tests whether the specified graphics block is "on" or "off". If the block is "on" (that is, if it has been SET), then POINT returns a binary True (-1 in LEVEL II BASIC). If the block is "off", POINT returns a binary False (0 in LEVEL II BASIC). Typically, the POINT test is put inside an IF-THEN statement.

```
100 SET(50,28) : IF POINT(50,28) THEN PRINT "ON" ELSE PRINT "OFF"
```

This line will always print the message, "ON", because POINT(50,28) will return a binary True, so that execution proceeds to the THEN clause. If the test failed, POINT would return a binary False, causing execution to jump to the ELSE statement.

## **ERL**

Returns the line number in which an error has occurred. This function is primarily used inside an error-handling routine accessed by an ON ERROR GOTO statement. If no error has occurred when ERL is called, line number 0 is returned. However, if an error has occurred since power-up, ERL returns the line number in which the error occurred. If error occurred in direct mode, 65535 is returned (largest number representable in two bytes).

---

```
Example Program using ERL
5      ON ERROR GOTO 1000
10     CLEAR 10
20     INPUT "ENTER YOUR MESSAGE";MS
30     INPUT "NOW ENTER A NUMBER";N : N=1/N
40     REM REST OF PROGRAM BEGINS HERE
.
.
999 END
1000 IF ERL=20 THEN 1010 ELSE IF ERL=30 THEN 1020
1005 ON ERROR GOTO 0
1010 PRINT "TRY AGAIN-KEEP MESSAGE UNDER 11 CHARACTERS"
1015 RESUME 20
1020 PRINT "FORGOT TO MENTION: NUMBER MUST NOT BE ZERO"
1025 RESUME 30
```

RUN the program. Try entering a long message; try entering zero when the program asks for a number. Note that ERL is used in line 1000 to determine where the error occurred so that appropriate action may be taken.

## ERR/2+1

Similar to ERL, except ERR returns a value related to the code of the error rather than the line in which the error occurred. Commonly used inside an error handling routine accessed by an ON ERROR GOTO statement. See Appendix B, "Error Codes."

ERR/2+1 = true error code  
(true error code - 1)\*2=ERR

### Example Program

```
10     ON ERROR GOTO 1000
20     DIM A(15) : I=1
30     READ A(1)
40     I=I+1 : GOTO 30
50     REM REST OF PROGRAM
.
.
100    DATA 2,3,5,7,1,13
999   END
1000  IF ERR/2+1=4 RESUME 50
1010  ON ERROR GOTO 0
```

Note line 1000: 4 is the error code for Out of Data.

## **INP(*port*)**

Returns a byte-value from the specified port. The TRS-80 Expansion Interface is required to use INP effectively (with user-supplied peripheral hardware). There are 256 ports, numbered 0-255. For example

```
100 PRINT INP(50)
```

inputs a byte from port 50 and prints the decimal value of the byte.

## **MEM**

Returns the number of unused and unprotected bytes in memory. This function may be used in the Command Mode to see how much space a resident program takes up; or it may be used inside the program to avert OM (Out of Memory) errors by allocating less string space, DIMensioning smaller array sizes, etc. MEM requires no argument.

Example:

```
100 IF MEM < 80 THEN 900
110 DIM A(15)
.
.
.
```

Enter the command PRINT MEM (in Command Mode) to find out the amount of memory not being used to store programs, variables, strings, stack, or reserved for object-files.

## **OUT *port, value***

Outputs a byte value to the specified port. OUT is not a function but a statement complete in itself. It requires two arguments separated by a comma (no parenthesis): the port destination and the byte value to be sent.

Example:

```
OUT 250,10
```

sends the value "10" to port 250. Both arguments are limited to the range 0-255.

OUT, like INP, becomes useful when you add the TRS-80 Expansion Interface. See INP.

---

### **PEEK(address)**

Returns the value stored at the specified byte address (in decimal form). To use this function, you'll need to refer to two sections of the Appendix: the Memory Map (so you'll know where to PEEK) and the Table of Function, ASCII and Graphics Codes (so you'll know what the values represent).

If you're using PEEK to examine object files, you'll also need a microprocessor instruction set manual (one is included with the TRS-80 Editor/Assembler Instruction Manual).

PEEK is valuable for linking machine language routines with LEVEL II BASIC programs. The machine language routine can store information in a certain memory location, and PEEK may be used inside your BASIC program to retrieve the information. For example,

**A = PEEK (17999)**

returns the value stored at location 17999 and assigns that value to the variable A.

Peek may also be used to retrieve information stored with a POKE statement. Using PEEK and POKE allows you to set up very compact, byte-oriented storage systems. Refer to the Memory Map in the Appendix to determine the appropriate locations for this type of storage. See POKE, USR.

---

### **POKE address, value**

Loads a value into a specified memory location. POKE is not a function but a statement complete in itself. It requires two arguments: a byte address (in decimal form) and a value. The value must be between 0 and 255 inclusive. Refer to the Memory Map in the Appendix to see which addresses you'd like to POKE.

To POKE (or PEEK) an address above 32767, use the following formula: -1 \* (desired address - 32767) = POKE or PEEK address.

POKE is useful for LEVEL II graphics. Look at the Video Display Worksheet in the Appendix. In each of the 1024 PRINT locations there are 6 subdivisions. If we call each PRINT position a byte, then the smaller boxes are bits. We know that there are 8 bits per byte; so what happened to the other 2? One is used to identify the byte as a graphics or ASCII code. The other bit is not used. The remaining 6 bits contain either an ASCII, graphics or control code.

---

We can use POKE to turn on the entire PRINT position (6 bits) at one time. When we use SET, only 1 bit is turned **on**. Therefore POKE is about 6 times faster than SET. The following program demonstrates this speed.

```
10 CLS
20 FOR X=15360 TO 16383
30 POKE X, 191
40 NEXT
50 GOTO 50
```

RUN the program to see how fast the screen is "painted" white. (191 is the code for "all bits on". 15360 to 16383 are the Video Display memory addresses.)

Since POKE can be used to store information **anywhere** in memory, it is very important when we do our graphics to **stay in the range** for display locations. If we POKE outside this range, we may store the byte in a critical place. We could be POKEing into our program, or even in worse places like the stack. Indiscriminate POKEing can be disastrous. You might have to reset or power off and start over again. Unless you know where you are POKEing – don't.

See PEEK, USR, SET, and Chapter 4, CHRS for background material.

### POS(x)

Returns a number from 0 to 63 indicating the **current cursor** position on the Display. Requires a "dummy argument" (any numeric expression).

```
100 PRINT TAB(40) POS(0)
```

prints 40 at position 40. (Note that a blank is inserted before the "4" to accommodate the sign; therefore the "4" is actually at position 41.) The "0" in "POS(0)" is the dummy argument.

```
100 PRINT "THESE" TAB(POS(0)+5) "WORDS" TAB(POS(0)+5) "ARE";
110 PRINT TAB(POS(0)+5) "EVENLY" TAB(POS(0)+5) "SPACED"
```

**RUN**

```
THESE WORDS ARE EVENLY SPACED
READY
>-
```

## **USR (x)**

Calls a machine language subroutine and passes the argument to the subroutine (you may not need it, in which case it is a dummy argument). Such a subroutine could be loaded from tape, or created by POKEing microprocessor instructions into the appropriate memory locations. To use the USR function, you should be familiar with the machine-language programming (as explained in the TRS-80 Editor/Assembler Instruction Manual or any Z-80 Programming Manual). Playing around with the USR function can be disastrous to any programs you may have resident in the TRS-80; so do some studying before you attempt to use it.

There is only one allowable USR call in LEVEL II BASIC. In LEVEL II DISC BASIC, there will be up to 10: USR0 through USR9.

### **Example:**

**100 X=USR(N)**

would cause the Computer to branch to the routine beginning at the location POKEd into the USR(N) addresses 16526-16527. n is also stored at 2687 as a 2-byte integer. Upon return from the routine, the variable X would be given the value passed back from the routine. If no value is passed, X is assigned the value of the argument N.

N must be an integer between -32768 and 32767.

To create a machine language subroutine for access by USR, you must protect an area in high memory. (See Appendix D, "Memory Map"). First determine how many bytes your routine will require. Then subtract that number from your Computer's highest Memory address (depending on whether your TRS-80 has 4K or 16K bytes of memory). The resultant number will be the address where your protected memory should begin. Turn on the TRS-80, and answer the MEMORY SIZE question by entering the address where protected memory should begin. Addresses above that number will now be reserved for machine language data and routines.

Load the machine language routine, using POKE or via the cassette interface using the SYSTEM command (see Chapter 2, SYSTEM). Then, at the point where you want your BASIC program to branch to the machine language routine, insert a statement which calls USR(0). For example,

**50 PRINT USR(N)**

or

**50 A = USR(I%) + B**

To pass the argument to the subroutine, the subroutine should immediately execute a CALL 0A7F(hex) i.e., call 2687(dec).

There are two ways to return to your BASIC program from the machine-language subroutine:

- 1) If you don't wish to pass any values from the subroutine back to the BASIC program, a machine-language RET instruction can be used.
- 2) To return a value, load the value into the HL register pair as a two-byte signed integer and execute a JUMP to location 0A9A (HEX) [2714 (DEC)]. HL will be returned as a signed 2-byte integer.

The last thing you need to do is tell your BASIC program what address to branch to in the machine language routine. This two-byte address must be POKEd into memory locations 16526 and 16527. POKE the least significant byte into the lower (16526) memory location.

For example, if your routine begins at 32000: in hexadecimal this is 7D00. Therefore we POKE 00 (HEX) into 16526, and 7D (HEX) into 16527. Since POKE requires arguments in decimal form, we use:

**POKE 16526,0 : POKE 16527,208**

(208 decimal = 7D hex).

After you have executed the above line, when you use the USR(0) function, the Computer will branch to the instruction stored at 32000.

Note: locations 16526-16527 contain the address of the Illegal Function Call routine unless modified by POKE.

USR routines are automatically allocated up to 8 stack levels or 16 bytes (a high and low memory byte for each stack level). If you need more stack space, you can save the BASIC stack pointer and set up your own stack. However, this gets complicated; be sure you know what you're doing. See Chapter 2, **SYSTEM**, and this chapter, **PEEK**, **POKE**.

### **VARPTR (*variable name*)**

Returns an address-value which will help you locate where the variable name and its value are stored in memory. If the variable you specify has not been assigned a value, an FC error will occur when this function is called.

If VARPTR(*integer variable*) returns address K:  
Address K contains the least significant byte (LSB) of 2-byte integer K (two's complement form).  
Address K+1 contains the most significant byte (MSB) of integer K.

If VARPTR(*single precision variable*) returns address K:

- (K)\* = LSB of value
- (K+1) = Next most sig. byte (Next MSB)
- (K+2) = MSB
- (K+3) = exponent of value

If VARPTR(*double precision variable*) returns K:

- (K) = LSB of value
- (K+1) = Next MSB
- (K+2) = Next MSB
- (K+6) = MSB
- (K+7) = exponent of value

IF VARPTR(*string variable*) returns K:

- (K) = length of string
- (K+1) = LSB of string value starting address
- (K+2) = MSB of string value starting address

For single and double precision values, the number is stored in normalized exponential form, so that a decimal is assumed before the MSB. 128 is added to the exponent. Furthermore, the high bit of MSB is used as a sign bit. See examples below.

Examples:

A! = 4 will be stored as follows:

4 = 10 Binary, normalized as .1E2

So exponent of A is  $128+2 = 130$

MSB of A is 10000000:

however, the high bit is changed to zero since the value is positive.

So A! is stored as

Exponent	MSB	Next MSB	LSB
130	0	0	0

A! = -.5 will be stored as

Exponent	MSB	Next MSB	LSB
-128	128	0	0

\* (K) signifies "contents of address K"

**A! = 7** will be stored as

Exponent	MSB	Next MSB	LSB
131	96	0	0

**A! = -7 :**

Exponent	MSB	Next MSB	LSB
131	224	0	0

Zero is simply stored as a zero-exponent. The other bytes are insignificant.

## Logical Operators

In Chapter 1 we described how AND, OR and NOT can be used with relational expressions. For example,

**100 IF A=C AND NOT (B>40) THEN 60 ELSE 50**

AND, OR and NOT can also be used for bit manipulation, bitwise comparisons, and Boolean operations. In this section, we will explain how such operations can be implemented using LEVEL II BASIC. However, we will not try to explain Boolean algebra, decimal-to-binary conversions, binary arithmetic, etc. If you need to learn about these subjects, Radio Shack's *Understanding Digital Computers* (Catalog Number 62-2027) would be a good place to start.

AND, OR and NOT convert their arguments to sixteen-bit, signed two's-complement integers in the range -32768 to +32767. They then perform the specified logical operation on them and return a result within the same range. If the arguments are not in this range, an "FC" error results.

The operations are performed in bitwise fashion; this means that each bit of the result is obtained by examining the bit in the same position for each argument.

The following truth tables show the logical relationship between bits:

OPERATOR	ARGUMENT 1	ARGUMENT 2	RESULT
AND	1	1	1
	0	1	0
	1	0	0
	0	0	0

OPERATOR	ARGUMENT 1	ARGUMENT 2	RESULT
OR	1	1	1
	1	0	1
	0	1	1
	0	0	0

OPERATOR	ARGUMENT	RESULT
NOT	1	0
	9	1

#### EXAMPLES:

(In all of the examples below, leading zeroes on binary numbers are not shown.)

- 63 AND 16=16 Since 63 equals binary 111111 and 16 equals binary 10000, the result of the AND is binary 10000 or 16.
- 15 AND 14=14 15 equals binary 1111, and 14 equals binary 1110, so 15 and 14 equals binary 1110 or 14.
- 1 AND 8=8 -1 equals binary 1111111111111111 and 8 equals binary 1000, so the result is binary 1000 or 8 decimal.
- 4 AND 2=0 4 equals binary 100 and 2 equals binary 10, so the result is binary 0 because none of the bits in either argument match to give a 1 bit in the result.
- 4 OR 2=6 Binary 100 OR'd with binary 10 equals binary 110, or 6 decimal.
- 10 OR 10=10 Binary 1010 OR'd with binary 1010 equals binary 1010, or 10 decimal.
- 1 OR -2=-1 Binary 1111111111111111 (-1) OR'd with binary 11111111111110 (-2) equals binary 1111111111111111, or -1.
- NOT 0=-1 The bit complement of binary 0 to 16 places is sixteen ones (11111111111111) or -1. Also NOT -1=0.
- NOT X NOT X is equal to -(X+1). This is because to form the sixteen bit two's complement of the number, you take the bit (one's) complement and add one.
- NOT 1=-2 The sixteen bit complement of 1 is 1111111111111110, which is equal to -(1+1) or -2.

A typical use of the bitwise operators is to test bits set in the TRS-80's input ports which reflect the state of some external device. This requires the TRS-80 Expansion Interface.

---

---

Bit position 7 is the most significant bit of a byte, while position 0 is the least significant.

For instance, suppose bit 1 of I/O port 5 is 0 when the door to Room X is closed, and 1 if the door is open. The following program will print "Intruder Alert" if the door is opened:

```
10 IF INP(5) AND 2 THEN PRINT "INTRUDER ALERT":GOTO 100  
20 GOTO 10
```

See Chapter 1, "Logical Operators".

## 9/Editing

LEVEL I users undoubtedly spent lots of time retyping long program lines, all because of a typo, or maybe just to make a minor change. Once a line had been entered, there was no way to alter the line — without starting all over and retyping it.

LEVEL II's editing features eliminate much of this extra work. In fact, it's so easy to alter program lines, you'll probably be able to do much more experimenting with multi-statement lines, complex expressions, etc.

Commands, subcommands, and special function keys described in this chapter:

EDIT	L	ND
<b>ENTER</b>	X	NC
Space-Bar	I	NSC
<i>n</i> →	A	NKC
SHIFT ↓	E	
	Q	
	H	

### **EDIT line number**

This command puts you in the Edit Mode. You must specify which line you wish to edit, in one of two ways:

**EDIT line-number **ENTER**** Lets you edit the specified line.  
If line number is not in use,  
an FC error occurs

**EDIT.** Lets you edit the current program line — last line entered or altered or in which an error has occurred.

For example, type in and **ENTER** the following line:

**100 FOR I = 1 TO 10 STEP .5 : PRINT I, I+2, I+3 : NEXT**

This line will be used in exercising all the Edit subcommands described below.

Now type EDIT. and hit **ENTER**. The Computer will display:

**100 —**

You are now in the Edit Mode and may begin editing line 100.

### ENTER key

Hitting **ENTER** while in the Edit Mode causes the Computer to record all the changes you've made (if any) in the current line, and returns you to the Command Mode.

### *n*Space-bar

In the Edit Mode, hitting the Space-bar moves the cursor over one space to the right and displays any character stored in the preceding position. For example, using line 100 entered above, put the Computer in the Edit Mode so the Display shows:

100 —

Now hit the Space-Bar. The cursor will move over one space, and the first character of the program line will be displayed. If this character was a blank, then a blank will be displayed. Hit the Space-Bar until you reach the first non-blank character:

100 F—

is displayed. To move over more than one space at a time, hit the desired number of spaces first, and then hit the space-bar. For example, enter 5 and hit Space-bar, and the display will show something like this (may vary depending on how many blanks you inserted in the line):

100 FOR I=

Now type 8 and hit the Space-bar. The cursor will move over 8 spaces to the right, and 8 more characters will be displayed.

### *n* ← (Backspace)

Moves the cursor to the left by *n* spaces. If no number *n* is specified, the cursor moves back one space. When the cursor moves to the left, all characters in its "path" are erased from the display, but they are not deleted from the program line. For example, assuming you've used *n*Space-Bar so that the Display shows:

100 FOR I=1 TO 10 —

type 8 and hit the ← key. The Display will show something like this:

100 FOR I=— (will vary depending on number of blanks in your line 100 )

## **SHIFT &**

Hitting SHIFT and & keys together effects an escape from any of the Insert subcommands listed below: X, I and H. After escaping from an Insert subcommand, you'll still be in the Edit Mode, and the cursor will remain in its current position. (Hitting **ENTER** is another way to exit these Insert subcommands).

### **L (List Line)**

When the Computer is in the Edit Mode, and is not currently executing one of the subcommands below, hitting L causes the remainder of the program line to be displayed. The cursor drops down to the next line of the Display, reprints the current line number, and moves to the first position of the line. For example, when the Display shows

100 —

hit L (without hitting **ENTER** key) and line 100 will be displayed:

```
100 FOR I=1 TO 10 STEP .5 : PRINT I, I&2, I&3 : NEXT  
100 —
```

This lets you look at the line in its current form while you're doing the editing.

### **X (End of Line and Insert)**

Causes the rest of the current line to be displayed, moves cursor to end of line, and puts Computer in the Insert subcommand mode so you can add material to the end of the line. For example, using line 100, when the Display shows

100 —

hit X (without hitting **ENTER**) and the entire line will be displayed; notice that the cursor now follows the last character on the line:

```
100 FOR I=1 TO 10 STEP .5 : PRINT I, I&2, I&3 : NEXT —
```

We can now add another statement to the line, or delete material from the line by using the → key. For example, type : PRINT "DONE" at the end of the line. Now hit **ENTER**. If you now type LIST 100, the Display should show something like this:

```
100 FOR I=1 TO 10 STEP .5 : PRINT I, I&2, I&3 : NEXT : PRINT "DONE"
```

## I (Insert)

Allows you to insert material beginning at the current cursor position on the line. (Hitting **→** will actually delete material from the line in this mode.) For example, type and **ENTER** the EDIT 100 command, then use the Space Bar to move over to the decimal point in line 100. The Display will show:

**100 FOR I=1 TO 10 STEP —**

Suppose you want to change the increment from .5 to .25. Hit the **I** key (don't hit **ENTER**) and the Computer will now let you insert material at the current position. Now hit **2** so the Display shows:

**100 FOR I=1 TO 10 STEP .2**

You've made the necessary change, so hit SHIFT **↓** to escape from the Insert Subcommand. Now hit **L** key to display remainder of line and move cursor back to the beginning of the line:

**100 FOR I=1 TO 10 STEP .25 : PRINT I, I~~2~~2, I~~3~~3 : NEXT : PRINT "DONE"**  
**100 —**

You can also exit the Insert subcommand and save all changes by hitting **ENTER**. This will return you to Command mode.

## A (Cancel and Restart)

Moves the cursor back to the beginning of the program line and cancels editing changes already made. For example, if you have added, deleted, or changed something in a line, and you wish to go back to the beginning of the line and cancel the changes already made: first hit SHIFT **↓** (to escape from any subcommand you may be executing); then hit **A**. (The cursor will drop down to the next line, display the line number and move to the first program character.

## E (Save Changes and Exit)

Causes Computer to end editing and save all changes made. You must be in Edit Mode, not executing any subcommand, when you hit **E** to end editing.

## Q (Cancel and Exit)

Tells Computer to end editing and cancel all changes made in the current editing session. If you've decided not to change the line, type **Q** to cancel changes and leave Edit Mode.

## H (Hack and Insert)

Tells Computer to delete remainder of line and lets you insert material at the current cursor position. Hitting **→** will actually delete a character from the line in this mode. For example, using line 100 listed above, enter the Edit Mode and space over to the last statement, PRINT "DONE". Suppose you wish to delete this statement and insert an END statement. Display will show:

```
100 FOR I=1 TO 10 STEP .25 : PRINT I, I+2, I+3 : NEXT : _
```

Now type H and then type END. Hit **ENTER** key. List the line:

```
100 FOR I=1 TO 10 : STEP .25 : PRINT I, I+2, I+3 : NEXT : END
```

should be displayed.

## nD (Delete)

Tells Computer to delete the specified number *n* characters to the right of the cursor. The deleted characters will be enclosed in exclamation marks to show you which characters were affected. For example, using line 100, space over to the PRINT command statement:

```
100 FOR I=1 TO 10 : STEP .25 : _
```

Now type 19D. This tells the Computer to delete 19 characters to the right of the cursor. The Display should show something like this:

```
100 FOR I=1 TO 10 : STEP .25 : !PRINT I, I+2, I+3 : _
```

When you list the complete line, you'll see that the PRINT statement has been deleted.

## nC (Change)

Tells the Computer to let you change the specified number of characters beginning at the current cursor position. If you type C without a preceding number, the Computer assumes you want to change one character. When you have entered *n* number of characters, the Computer returns you to the Edit Mode (so you're not in the *nC* Subcommand). For example, using line 100, suppose you want to change the final value of the FOR-NEXT loop, from "10" to "15". In the Edit Mode, space over to just before the "0" in "10".

```
100 FOR I=1 TO 1_
```

Now type C. Computer will assume you want to change just one character. Type 5, then hit L. When you list the line, you'll see that the change has been made.

```
100 FOR I=1 TO 15 STEP .25 : NEXT : END
```

would be the current line if you've followed the editing sequence in this chapter.

### **nSc (Search)**

Tells the Computer to search for the *n*th occurrence of the character *c*, and move the cursor to that position. If you don't specify a value for *n*, the Computer will search for the first occurrence of the specified character. If character *c* is not found, cursor goes to the end of the line. Note: The Computer only searches through characters to the right of the cursor.

For example, using the current form of line 100, type EDIT 100 ( **ENTER** ) and then hit **2S:** . This tells the Computer to search for the second occurrence of the colon character. Display should show:

```
100 FOR I=1 TO 15 STEP .25 : NEXT _
```

You may now execute one of the subcommands beginning at the current cursor position. For example, suppose you want to add the counter variable after the NEXT statement. Type I to enter the Insert subcommand, then type the variable name, I. That's all you want to insert, so hit SHIFT ↓ to escape from the Insert subcommand. The next time you list the line, it should appear as:

```
100 FOR I=1 TO 15 STEP .25 : NEXT I: END
```

### **nKc (Search and "Kill")**

Tells the Computer to delete all characters up to the *n*th occurrence of character *c*, and move the cursor to that position. For example, using the current version of line 100, suppose we want to delete the entire line up to the END statement. Type EDIT 100 ( **ENTER** ), and then type **2K:** . This tells the Computer to delete all characters up to the 2nd occurrence of the colon. Display should show:

```
100 IFOR I=1 TO 15 STEP .25 : NEXT II_
```

The second colon still needs to be deleted, so type **D** . The Display will now show:

```
100 IFOR I=1 TO 15 STEP .25 : NEXT III:I_
```

Now hit **ENTER** and type LIST 100 ( **ENTER** ).

Line 100 should look something like this:

```
100 END
```

## 10/Expansion Interface

An Expansion Interface is available for the TRS-80 LEVEL II Computer. This interface will allow the use of additional Input/Output devices. There is also a provision for adding RAM memory. The Interface will allow four major additions to the TRS-80:

1. An additional cassette deck
2. A TRS-80 Line Printer
3. Up to four Mini-Disks
4. Up to 48K bytes of RAM Memory (32K in the Expansion Interface)

These devices are available from your Radio Shack store or dealer. To set up the Expansion Interface and any of the external devices, see the Expansion Interface instructions.

When the Expansion Interface is hooked up to the TRS-80, the Computer assumes that a Mini-Disk is interfaced. The Mini Disk will allow the use of additional commands and statements listed later. Even if you don't have a Mini Disk, the Computer will assume you do (because of the presence of the Disk Controller) and will try to input special instructions from the Disk Controller. Therefore, to use the Interface without a Mini Disk, hold down the BREAK key as you turn on the TRS-80. This will override the mini-disk mode and allow normal LEVEL II operation. Whenever you need to press the Reset button, you must also hold down the BREAK key.

### Dual Cassettes

The use of two cassettes will allow a much more efficient and convenient manner of updating data stored on tape. For example, if you have payroll data stored on tape, the information can be read in one item at a time from cassette #1 then changed or added and written out on cassette #2, one item at a time. The routine might look like this:

```
10 INPUT #1,A,B,C,D
20 PRINT "MAKE CORRECTIONS HERE: RETYPE LINE"
30 INPUT A,B,C,D
40 PRINT "THE LINE NOW READS:" A,B,C,D
50 PRINT "STORING ON TAPE #2..."
60 PRINT #2, A,B,C,D
70 GOTO 10
```

This is a very simple application; however, very powerful routines can be constructed to allow input and output of data using two tapes simultaneously.

See Chapter 3, PRINT.

## Codes

Several codes are used to control the output of the line printer. The codes and their functions are listed below. The CHR\$ function is used to call up these function codes. For example:

**PRINT CHR\$ (10)**

will generate a line feed.

CODE	FUNCTION
10	line feed with carriage return
11	line feed with carriage return
12	Move carriage to top of form (page)
13	carriage return

**NOTE:** At the end of a line, a line feed is automatically generated unless a semi-colon is used at the end of the PRINT statement.

The line printer will print 6 lines per inch and 66 lines per page. If this format is not suitable, the number of lines per page can be changed by POKEing the new number of lines into memory location 16424.

**Example:**

**POKE 16424, 40**

This instructs the Line Printer to print 40 lines per page.

## Mini-Disks – (LEVEL II DISK BASIC)

The TRS-80 Mini Disk System is a small version of a floppy disk. The disk allows vast file storage space and much quicker access time than you get with tape storage. Disc 0 will contain about 80,000 bytes of free space for files. Each additional disk will have 89,600 bytes of file space. The disk system has its own set of commands which allow manipulations of files and expanded abilities in file use. The TRS-80 Mini Disk System allows both sequential and random access. The disks will also allow use of several additional BASIC commands and functions:

**Commands:**

CLOSE	LSET	PUT
FIELD	NAME	RSET
GET	OPEN	MERGE
KILL	PRINT	LOAD

## I/O Functions

CVD	LOF
CVI	MKD\$
CVS	MKIS\$
EOF	MKSS\$
LOC	DSKF

## Additions to LEVEL II

Ten **USR** calls - USR0 through USR9      **INSTR** (performs function of INSTRING subroutine  
- see Chapter 4)  
**&H** (hex constants)  
**&O** (octal constants)      **TIMES** (Date and 24-Hr.  
Real-Time Clock.)  
**DEFUSR**  
**LINE INPUT**      **DEF FN** (User Defined Functions)  
**MID\$** (on left side of equation)

For explanation of these commands/functions, see the TRS-80 Disk Operating System Manual.

## Expansion of RAM Memory

The TRS-80 Expansion Interface has provisions for adding extra RAM memory. This is done by adding RAM memory chips. You can add up to 32,768 additional bytes of memory. For price information and installation, see your Radio Shack store or dealer.

# 11/Saving Time and Space

Most LEVEL II programs are faster and take up less memory space than their LEVEL I counterparts. But even with its inherently more efficient features, LEVEL II can be further streamlined by following a few simple guidelines when constructing your program.

## Saving Memory Space

- 1) When your program is operating properly, delete all unnecessary REM statements from your running version.
- 2) Do not use unnecessary spaces between statements, operators, etc.
- 3) When possible, use multiple-statement program lines (with a colon between each two statements). Each time you enter a new line number it costs you 5 bytes.
- 4) Use integer variables whenever possible, for example,

FOR I% = 1 TO 10

Integers take only two bytes. Single precision takes 7 and double precision takes 11 bytes.

- 5) Using subroutines will save program space if the operation is called from different places several times. If a routine is always called from the same place, use unconditional branches (GOTO's). Each active GOSUB takes 6 bytes: a GOTO takes none at Run time.
- 6) Structure your calculations so as to use as few parentheses as possible (refer to Chapter 1, "Arithmetic Operators"). It takes 4 bytes to process parentheses. And since these operations inside parentheses are done first, the result of each parenthetical expression must be stored (this takes 12 bytes).
- 7) Dimension arrays sparingly. When you set up a matrix, the Computer reserves 11 subscript addresses for each DIMension, even if the space is not filled. Use the zero subscripted elements, since they are always available.
- 8) Use DEF statements when you will be working with values other than single precision (strings, integers and double precision). A DEF statement takes 6 bytes but this is made up for fairly quickly since you don't need to use type declaration characters with the variable names.

## **Speeding Up Execution**

The speed at which a program is processed will depend on the complexity of the operations and the number of instructions. In most simple programs, speed will not be a factor. It will seem as though the answer is returned the moment you enter RUN. However, as you begin writing longer and more intricate programs, speed will become a significant factor. Here are some suggestions to guide you in designing speedier programs.

- 1) Delete all unnecessary lines in the program (REM statements, etc.)
- 2). Combine multi-statement program lines when practical.
- 3) Use variables rather than constants in operations (very important). Your TRS-80 normally operates using floating decimal point values. It takes a lot less time to access a variable than to convert a constant to floating point representation. For example: if you will use  $\pi$  a lot in a program, define  $\pi$  as a variable (PI=3.14159) and use the variable (PI) in the operations.
- 4) Use POKE graphics. This can speed up your graphics displays by a factor of 6.
- 5) Define the most commonly used variables first. When a variable is defined it is located at the top of the variable table. The second will be just below that. When variables are accessed, the table will be searched to find the variable. Therefore, you will save time by locating frequently used variables at the top of the table (by defining them first). The Computer will not have to look as far to find them.
- 6) Use integer variables, especially in FOR-NEXT loops, when possible. This is most important of all.

# A/Level II Summary

## Special Characters and Abbreviations

### Command Mode

---

<b>ENTER</b>	Return carriage and interpret command
←	Cursor backspace and delete last character typed
SHIFT ←	Cursor to beginning of logical line; erase line
↑	Linefeed
:	Statement delimiter; use between statements on same logical line
→	Move cursor to next tab stop. Tab stops are at positions 0, 8, 16, 24, 32, 40, 48, and 56.
SHIFT →	Convert display to 32 characters per line
CLEAR	Clear Display and convert to 64 characters per line

### Execute Mode

---

SHIFT @	Pause in execution; freeze display during LIST
BREAK	Stop execution
<b>ENTER</b>	Interpret data entered from Keyboard with INPUT statement

### Abbreviations

---

?	Use in place of PRINT.
'	Use in place of :REM
.	"Current line"; use in place of line number with LIST, EDIT, etc.

---

#### Type Declaration Characters

---

Character	Type	Examples
S	String	A\$ , ZZ\$
%	Integer	A1%, SUM%
!	Single-Precision	B1!, N1!
*	Double-Precision	A#, 1/3#
D	Double-Precision (exponential notation)	1.23456789D-12
E	Single-Precision (exponential notation)	1.23456E+30

---

#### Arithmetic Operators

---

+ add      - subtract      \* multiply      / divide  
^ exponentiate (e.g.,  $2 \wedge 3 = 8$ )

---

#### String Operator

---

+ concatenate (string together)      "2" + "2" = "22"

---

#### Relational Operators

---

Symbol	meaning in numeric expressions	in string expressions
<	is less than	precedes
>	is greater than	follows
=	is equal to	equals
$\leq$ or $=<$	is less than or equal to	precedes or equals
$\geq$ or $=>$	is greater than or equal to	follows or equals
$\neq$ or $><$	does not equal	does not equal

---

### **Order of Operations (operators on same line have same precedence)**

---

↑ (Exponentiation)  
¬ (Negation)  
\*, /  
+, -  
Relational operators  
NOT  
AND  
OR

## **Commands**

<b>Command</b>	<b>Function</b>	<b>Examples</b>
AUTO <i>mm,nn</i>	Turn on automatic line numbering beginning with <i>mm</i> , using increment of <i>nn</i> .	<b>AUTO</b> <b>AUTO 10</b> <b>AUTO 5.5</b> <b>AUTO ..10</b>
CLEAR	Set numeric variables to zero, strings to null.	<b>CLEAR</b>
CLEAR <i>n</i>	Same as CLEAR but also sets aside <i>n</i> bytes for strings.	<b>CLEAR 500</b> <b>CLEAR MEM/4</b>
CONT	Continue after BREAK or STOP in execution.	<b>CONT</b>
DELETE <i>mm-nn</i>	Delete program lines from line <i>mm</i> to line <i>nn</i> .	<b>DELETE 100</b> <b>DELETE 10-50</b> <b>DELETE .</b>
EDIT <i>mm</i>	Enter Edit Mode for line <i>mm</i> . See Edit Mode Sub-commands below.	<b>EDIT 100</b> <b>EDIT .</b>
LIST <i>mm-nn</i>	List all program lines from <i>mm</i> to <i>nn</i> .	<b>LIST</b> <b>LIST 30-60</b> <b>LIST 30-</b> <b>LIST -90</b> <b>LIST .</b>

---

<b>NEW</b>	Delete entire program and reset all variables, pointers etc.	<b>NEW</b>
<b>RUN mm</b>	Execute program beginning at lowest numbered line or <i>mm</i> if specified.	<b>RUN</b> <b>RUN 55</b>
<b>SYSTEM</b>	Enter Monitor Mode for loading of machine-language file from cassette.	See Chapter 2
<b>TROFF</b>	Turn off Trace	<b>TROFF</b>
<b>TRON</b>	Turn on Trace	<b>TRON</b>

### **Edit Mode Subcommands and Function Keys**

<b>Subcommand/Function Key</b>	<b>Function</b>
<b>ENTER</b>	End editing and return to Command Mode.
<b>SHIFT &amp;</b>	Escape from subcommand and remain in Edit Mode.
<b>nSpace-Bar</b>	Move cursor <i>n</i> spaces to right.
<b>n ←</b>	Move cursor <i>n</i> spaces to left.
<b>L</b>	List remainder of program line and return to beginning of line.
<b>X</b>	List remainder of program line, move cursor to end of line, and start Insert subcommand.
<b>I</b>	Insert the following sequence of characters at current cursor position; use Escape to exit this subcommand.
<b>A</b>	Cancel changes and return cursor to beginning of line.
<b>E</b>	End editing, save all changes and return to Command Mode.
<b>Q</b>	End editing, cancel all changes made and return to Command Mode.

<b>H</b>	Delete remainder of line and insert following sequence of characters; use Escape to exit this subcommand.
<b>nD</b>	Delete specified number of characters <i>n</i> beginning at current cursor position.
<b>nC</b>	Change (or replace) the specified number of characters <i>n</i> using the next <i>n</i> characters entered.
<b>nSc</b>	Move cursor to <i>n</i> th occurrence of character <i>c</i> , counting from current cursor position.
<b>nKc</b>	Delete all characters from current cursor position up to <i>n</i> th occurrence of character <i>c</i> , counting from current cursor position.

## Input/Output Statements

Statement*	Function	Examples
<b>PRINT <i>exp</i></b>	Output to Display the value of <i>exp</i> . <i>Exp</i> may be a numeric or string expression or constant, or a list of such items.	<b>PRINT A\$</b> <b>PRINT X+3</b> <b>PRINT "D" D</b>
<b>,</b>	Comma serves as a PRINT modifier. Causes cursor to advance to next print zone.	<b>PRINT 1,2,3,4</b> <b>PRINT "1","2"</b> <b>PRINT 1,,2</b>
<b>:</b>	Semi-colon serves as a PRINT modifier. Inserts a space after a numeric item in PRINT list. Inserts no space after a string item. At end of PRINT list, suppresses the automatic carriage return.	<b>PRINT X,:"ANSWER"</b> <b>PRINT X;Y Z</b> <b>PRINT "ANSWER IS":</b>

\**exp* may be a string or numeric constant or variable, or a list of such items.

<b>PRINT @<i>n</i></b>	PRINT modifier: begin PRINTing at specified display position <i>n</i> .	<b>PRINT @ 540,"CENTER"</b> <b>PRINT @ N+3,X*3</b>
<b>TAB <i>n</i></b>	Print modifier: moves cursor to specified Display position <i>n</i> (expres- sion).	<b>PRINT TAB(N) N</b>
<b>PRINT USING <i>string;exp</i></b>	PRINT format specifier: output <i>exp</i> in form speci- fied by <i>string</i> field (see below).	<b>PRINT USING AS:X</b> <b>PRINT USING "#.##";Y+Z</b>
<b>INPUT "message";<i>variable</i></b>	Print message"(if any) and await input from Key- board.	<b>INPUT"ENTER NAME":A\$</b> <b>INPUT"VALUE": X</b> <b>INPUT"ENTER NUMBERS" ;X,Y</b> <b>INPUT A,B,C,D\$</b>
<b>PRINT #<i>-1</i></b>	Output to Cassette # <i>1</i> .	<b>PRINT #—1,A,B,C,D\$</b>
<b>INPUT #<i>-1</i></b>	Input from Cassette # <i>1</i> .	<b>INPUT #—1,A,B,C,D\$</b>
<b>DATA <i>item list</i></b>	Hold data for access by READ state- ment.	<b>DATA 22,33,11,1.2345</b> <b>DATA "HALL","SMITH","DOE"</b>
<b>READ <i>variable list</i></b>	Assign value(s) to the specified vari- able(s), starting with current DATA element.	<b>READ A,A1,A2,A3</b> <b>READ A\$,B\$,C\$,D</b>
<b>RESTORE</b>	Reset DATA point- er to first item in first DATA state- ment.	<b>RESTORE</b>

## Field Specifiers for PRINT USING statements

Numeric Character	Function	Example
*	Numeric field (one digit per #).	***
.	Decimal point position.	=*,***
+	Print leading or trailing sign (plus for positive numbers, minus for negative numbers).	+*,*** *,***+ -**** *,***-
-	Print trailing sign only if value printed is negative.	***,-**
**	Fill leading blanks with asterisk.	**###,##
SS	Place dollar sign immediately to left of leading digit.	SS####,##
**\$	Dollars sign to left of leading digit and fill leading blanks with asterisks.	**\$###,##
↓↓↓↓	Exponential format, *.*==== with one significant digit to left of decimal.	*.*****↓↓↓↓

String Character	Function	Example
!	Single character.	!
%spaces%	String with length % equal to 2 plus number of spaces between % symbols.	% %

## Program Statements

Statement	Function	Examples
(Type Definition)		
<b>DEFDBL</b> <i>letter list or range</i>	Define as double-precision all variables beginning with specified letter, letters or range of letters.	<b>DEFDBL J</b> <b>DEFDBL X,Y,A</b> <b>DEFDBL A-E,J</b>
<b>DEFINT</b> <i>letter list or range</i>	Define as integer all variables beginning with specified letter, letters or range of letters.	<b>DEFINT A</b> <b>DEFINT C,E,G</b> <b>DEFINT A-K</b>
<b>DEFSNG</b> <i>letter list or range</i>	Define as single-precision all variables beginning with specified letter, letters or range of letters.	<b>DEFSNG L</b> <b>DEFSNG A-L, Z</b> <b>DEFSNG P,R,A-K</b>
<b>DEFSTR</b> <i>letter list or range</i>	Define as string all variables beginning with specified letter, letters or range of letters.	<b>DEFSTR A,B,C</b> <b>DEFSTR S,X-Z</b> <b>DEFSTR M</b>
(Assignment and Allocation)		
<b>CLEAR</b> <i>n</i>	Set aside specified number of bytes <i>n</i> for string storage.	<b>CLEAR 750</b> <b>CLEAR MEM/10</b> <b>CLEAR 0</b>
<b>DIM</b> <i>array(dim#1, . . . , dim#k)</i>	Allocate storage for <i>k</i> -dimensional array with the specified size per dimension: <i>dim#1, dim#2, . . . , etc.</i> <i>DIM</i> may be followed by a list of arrays separated by commas.	<b>DIM A(2,3)</b> <b>DIM A1(15), A2(15)</b> <b>DIM B(X+2),C(J,K)</b> <b>DIM T(3,3,5)</b>

Statement	Function	Examples
LET <i>variable</i> = <i>expression</i>	Assign value of <i>expression</i> to <i>variable</i> . LET is optional in LEVEL II BASIC.	LET A\$="CHARLIE" LET B1=C1 LET A%=1#
<b>(Sequence of Execution)</b>		
END	End execution, return to Command Mode.	99 END
STOP	Stop execution, print Break message with current line number. User may continue with CONT.	100 STOP
GOTO <i>line-number</i>	Branch to specified <i>line-number</i> .	GOTO 100
GOSUB <i>line-number</i>	Branch to sub- routine beginning at <i>line-number</i> .	GOSUB 3000
RETURN	Branch to statement RETURN following last- executed GOSUB.	
ON <i>exp</i> GOTO <i>line#1</i> , . . . , <i>line#k</i>	Evaluate expres- sion; if INT( <i>exp</i> ) equals one of the numbers 1 through <i>k</i> , branch to the appropriate line number. Otherwise go to next state- ment.	ON K+1 GOTO 100,200,300
ON <i>exp</i> GOSUB <i>line#1</i> , . . . , <i>line#k</i>	Same as ON . . . GOTO except branch is to sub- routine beginning at <i>line#1</i> , <i>line#2</i> , . . . or <i>line#k</i> , depending on <i>exp</i> .	ON J GOSUB 330,7000

Statement	Function	Examples
<b>FOR</b> <i>var</i> = <i>exp</i> <b>TO</b> <i>exp</i> <b>STEP</b> <i>exp</i>	Open a FOR-NEXT loop. STEP is optional; if not used, increment of one is used. See Chapter 4.	<b>FOR</b> I=1 <b>TO</b> 50 <b>STEP</b> 1.5 FOR M=J TO K-1
<b>NEXT</b> <i>variable</i>	Close FOR-NEXT loop. Variable may be omitted. To close nested loops, a variable list may be used. See Chapter 4.	<b>NEXT</b> <b>NEXT I</b> <b>NEXT I,J,K</b>
<b>ERROR</b> ( <i>code</i> )	Simulate the error specified by <i>code</i> (see Error Code Table).	<b>ERROR</b> (14)
<b>ON</b> <b>ERROR</b> <b>GOTO</b> <i>line-number</i>	If an error occurs in subsequent program lines, branch to error routine beginning at <i>line-number</i> .	<b>ON</b> <b>ERROR</b> <b>GOTO</b> 999
<b>RESUME</b> <i>n</i>	Return from error routine to line specified by <i>n</i> . If <i>n</i> is zero or not specified, return to statement containing error. If <i>n</i> is "NEXT", return to statement following error-statement.	<b>RESUME</b> <b>RESUME 0</b> <b>RESUME 100</b> <b>RESUME NEXT</b>
<b>RANDOM</b>	Reseeds random number generator	<b>RANDOM</b>
<b>REM</b>	REMark indicator; ignore rest of line	<b>REM A IS ALTITUDE</b>

Statement	Function	Examples
<b>(Tests – Conditional Statements)</b>		
<b>IF</b> <i>exp-1</i> <b>THEN</b> <i>statement-1</i> <b>ELSE</b> <i>statement-2</i>	Tests <i>exp-1</i> : If True, execute <i>statement-1</i> then jump to next pro- gram line (unless <i>statement-1</i> was a GOTO).  If <i>exp-1</i> is False, jump directly to <b>ELSE</b> statement and execute sub- sequent statements.	<b>IF A=0 THEN PRINT "ZERO"</b> <b>ELSE PRINT "NOT ZERO"</b>
<b>(Graphics Statements)</b>		
<b>CLS</b>	Clear Video Display.	<b>CLS</b>
<b>RESET(x,y)</b>	Turn off the graph- ics block with hori- zontal coordinate <i>x</i> and vertical coordi- nate <i>y</i> . 0 <= <i>X</i> < 128 and 0 <= <i>Y</i> < 48	<b>RESET(8+8,11)</b>
<b>SET (x,y)</b>	Turn on the graph- ics block specified by coordinates <i>x</i> and <i>y</i> . Same argu- ment limits as <b>RESET</b> .	<b>SET(A*2,B+C)</b>
<b>(Special Statements)</b>		
<b>POKE</b> <i>location,value</i>	Load <i>value</i> into memory <i>location</i> (both arguments in decimal form) 0 <= <i>value</i> <= 255.	<b>POKE 15635,34</b> <b>POKE 17770,A+N</b>
<b>OUT</b> <i>port,value</i>	Send <i>value</i> to <i>port</i> (both arguments between 0 and 255 inclusive)	<b>OUT 255,10</b> <b>OUT 55,A</b>

## String Functions

Function	Operation	Examples
<b>ASC(string)</b>	Returns ASCII code of first character in string argument.	<code>ASC(B\$)</code> <code>ASC("H")</code>
<b>CHR\$(code exp)</b>	Returns a one-character string defined by <i>code</i> . If <i>code</i> specifies a control function, that function is activated.	<code>CHR\$(34)</code> <code>CHR\$(I)</code>
<b>FRE(string)</b>	Returns amount of memory available for string storage Argument is a dummy variable.	<code>FRE(A\$)</code>
<b>INKEYS</b>	Strobes Keyboard and returns a one-character string corresponding to key pressed during strobe (null string if no key is pressed).	<code>INKEY\$</code>
<b>LEN(string)</b>	Returns length of <i>string</i> (zero for null string).	<code>LEN(A\$+B\$)</code> <code>LEN("HOURS")</code>
<b>LEFT\$(string,n)</b>	Returns first <i>n</i> characters of <i>string</i> .	<code>LEFT\$(A\$,1)</code> <code>LEFT\$(L\$+C\$,8)</code> <code>LEFT\$(A\$,M+L)</code>
<b>MIDS(string,p,n)</b>	Returns substring of <i>string</i> with length <i>n</i> and starting at position <i>p</i> in <i>string</i> .	<code>MIDS(M\$,5,2)</code> <code>MIDS(M\$+B\$,P,L-1)</code>
<b>RIGHT\$(string,n)</b>	Returns last <i>n</i> characters of <i>string</i> .	<code>RIGHT\$(N\$,7)</code> <code>RIGHT\$(A\$,M2)</code>
<b>STR\$(numeric exp)</b>	Returns a string representation of the evaluated argument.	<code>STR\$(1.2345)</code> <code>STR\$(A+B*2)</code>
<b>STRINGS(n,char)</b>	Returns a sequence of <i>n</i> <i>char</i> symbols using first character of <i>char</i> .	<code>STRINGS(30, ".")</code> <code>STRINGS(25, "A")</code> <code>STRINGS(5,C\$)</code>
<b>VAL(string)</b>	Returns a numeric value corresponding to a numeric-valued string.	<code>VAL("1"+A\$+"."+C\$)</code> <code>VAL(A\$+B\$)</code> <code>VAL(G1\$)</code>

\**string* may be a string variable, expression, or constant.

## Arithmetic Functions\*

Function	Operation (unless noted otherwise, -1.7E+38 <= exp <= 1.7E+38)	Examples
ABS(exp)	Returns absolute value.	ABS(L*.7) ABS(SIN(X))
ATN(exp)	Returns arctangent in radians.	ATN(2.7) ATN(A*3)
CDBL(exp)	Returns double-precision representation of exp.	CDBL(A) CDBL(A+1/3#)
CINT(exp)	Returns largest integer not greater than exp. Limits: -32768 <= exp <= 32768.	CINT(A#+B)
COS(exp)	Returns the cosine of exp; assumes exp is in radians.	COS(2*A) COS(A/57.29578)
CSNG(exp)	Returns single-precision representation, with 5/4 rounding in least significant decimal when exp is double-precision.	CSNG(A#=) CSNG(.33*B#)
EXP(exp)	Returns the natural exponential, $e^{exp}$ = EXP(exp).	EXP(34.5) EXP(A*B*C-1)
FIX(exp)	Returns the integer equivalent to truncated exp (fractional part of exp is chopped off).	FIX(A-B)
INT(exp)	Returns largest integer not greater than exp.	INT(A+B*C)
LOG(exp)	Returns natural logarithm (base e) of exp. Limits: exp must be positive.	LOG(12.33) LOG(A+B+B)
RND(0)	Returns a pseudo-random number between 0.000001 and 0.999999 inclusive.	RND(0)
RND(exp)	Returns a pseudo-random number between 1 and INT(exp) inclusive. Limits: 1 <= exp < 32768.	RND(40) RND(A+B)
SGN(exp)	Returns -1 for negative exp; 0 for zero exp; +1 for positive exp.	SGN(A*B+3) SGN(COS(X))

\*exp is any numeric-valued expression or constant.

<b>SIN(exp)</b>	Returns the sine of <i>exp</i> ; assumes <i>exp</i> is in radians.	<b>SIN(A,B)</b> <b>SIN(90/57.29578)</b>
<b>SQR(exp)</b>	Returns square root of <i>exp</i> . Limits: <i>exp</i> must be non-negative.	<b>SQR(A*A -B*B)</b>
<b>TAN(exp)</b>	Returns the tangent of <i>exp</i> ; assumes <i>exp</i> is in radians.	<b>TAN(X)</b> <b>TAN(X*.0174533)</b>

## Special Functions

Function	Operation and Limits	Examples
<b>ERL</b>	Returns line number of current error.	<b>ERL</b>
<b>ERR</b>	Returns a value related to current error code (if error has occurred). <i>ERR</i> = ( <i>error code</i> -1)*2. Also: ( <i>ERR</i> /2)+1 = <i>error code</i> .	<b>ERR/2+1</b>
<b>INP(<i>port</i>)</b>	Inputs and returns the current value from the specified <i>port</i> . Both argument and result are in the range 0 to 255 inclusive.	<b>INP(55)</b>
<b>MEM</b>	Returns total unused and unprotected bytes in memory.	<b>MEM</b>
<b>PEEK(<i>location</i>)</b>	Returns value stored in the specified memory byte. <i>location</i> must be a valid memory address in decimal form (see Memory Map in Appendix D).	<b>PEEK(15370)</b>
<b>POINT(x,y)</b>	Checks the graphics block specified by horizontal coordinate <i>x</i> and vertical coordinate <i>y</i> . If block is "on", returns a True (-1), if block is "off", returns a False (0). Limits: 0 <= <i>x</i> < 128, 0 <= <i>y</i> < 48.	
<b>POS(0)</b>	Returns a number indicating the current cursor position. The argument "0" is a dummy variable.	<b>POS(0)</b>
<b>USR(<i>n</i>)</b>	Branches to machine language subroutine. For LEVEL II BASIC, <i>n</i> must equal 0. See Chapter 3.	<b>USR(0)</b>
<b>VARPTR(<i>var</i>)</b>	Returns the address where the specified variable's name, value, and pointer are stored. <i>var</i> must be a valid variable name. Returns 0 if <i>var</i> has not been assigned a value.	<b>VARPTR(AS)</b> <b>VARPTR(N1)</b>

---

## LEVEL II Reserved Words\*

@	FIX	OUT
ABS	FOR	PEEK
AND	FRE	POINT

## **Program Limits and Memory Overhead**

### **Ranges**

Integers -32768 to +32767 inclusive

Single Precision -1.701411E+38 to +1.701411E+38 inclusive

Double Precision -1.701411834544556E+38 to +1.701411834544556E+38 inclusive

**String Range:** Up to 255 characters

**Line Numbers Allowed:** 0 to 65529 inclusive

**Program Line Length:** Up to 255 characters

### **Memory Overhead**

Program lines require 5 bytes minimum, as follows:

Line Number - 2 bytes

Line Pointer - 2 bytes

Carriage Return - 1 byte

In addition, each reserved word, operator, variable name, special character and constant character requires one byte.

### **Dynamic (RUN-time) Memory Allocation**

**Integer variables:** 5 bytes each  
(2 for value, 3 for variable name)

**Single-precision variables:** 7 bytes each  
(4 for value, 3 for variable name)

**Double-precision variables:** 11 bytes each  
(8 for value, 3 for variable name)

**String variables:** 6 bytes minimum  
(3 for variable name, 3 for stack and variable pointers, 1 for each character)

**Array variables:** 12 bytes minimum  
(3 for variable name, 2 for size, 1 for number of dimensions,  
2 for each dimension, and 2, 3, 4 or 8 [depending on array type]  
for each element in the array)

Each active FOR-NEXT loop requires 16 bytes.

Each active (non-returned) GOSUB requires 6 bytes.

Each level of parentheses requires 4 bytes plus 12 bytes for each temporary value.

## B/LEVEL II Error Codes

CODE	ABBREVIATION	ERROR
1	NF	NEXT without FOR
2	SN	Syntax error
3	RG	Return without GOSUB
4	OD	Out of data
5	FC	Illegal function call
6	OV	Overflow
7	OM	Out of memory
8	UL	Undefined line
9	BS	Subscript out of range
10	DD	Redimensioned array
11	/0	Division by zero
12	ID	Illegal direct
13	TM	Type mismatch
14	OS	Out of string space
15	LS	String too long
16	ST	String formula too complex
17	CN	Can't continue
18	NR	NO RESUME
19	RW	RESUME without error
20	UE	Unprintable error
21	MO	Missing operand
22	FD	Bad file data
23	L3	Disk BASIC only*

## **Explanation of Error Messages**

**NF** NEXT without FOR: NEXT is used without a matching FOR statement. This error may also occur if NEXT *variable* statements are reversed in a nested loop.

**SN** Syntax Error: This usually is the result of incorrect punctuation, open parenthesis, an illegal character or a mis-spelled command.

**RG** RETURN without GOSUB: A RETURN statement was encountered before a matching GOSUB was executed.

**OD** Out of Data. A READ or INPUT # statement was executed with insufficient data available. DATA statement may have been left out or all data may have been read from tape or DATA.

**FC** Illegal Function Call: An attempt was made to execute an operation using an illegal parameter. Examples: square root of a negative argument, negative matrix dimension, negative or zero LOG arguments, etc. Or USR call without first POKEing the entry point.

**OV** Overflow: A value input or derived is too large or small for the computer to handle.

**OM** Out of Memory: All available memory has been used or reserved. This may occur with very large matrix dimensions, nested branches such as GOTO, GOSUB, and FOR-NEXT Loops.

**UL** Undefined Line: An attempt was made to refer or branch to a non-existent line.

**BS** Subscript out of Range: An attempt was made to assign a matrix element with a subscript beyond the DIMensioned range.

**DD** Redimensioned Array: An attempt was made to DIMension a matrix which had previously been dimensioned by DIM or by default statements. It is a good idea to put all dimension statements at the beginning of a program.

**/0** Division by Zero: An attempt was made to use a value of zero in the denominator.

**ID** Illegal Direct: The use of INPUT as a direct command.

**TM** Type Mismatch: An attempt was made to assign a non-string variable to a string or vice-versa.

**OS** Out of String Space: The amount of string space allocated was exceeded.

**LS** String Too Long: A string variable was assigned a string value which exceeded 255 characters in length.

**ST** String Formula Too Complex: A string operation was too complex to handle. Break up the operation into shorter steps.

**CN** Can't Continue: A CONT was issued at a point where no continuable program exists, e.g., after program was ENDED or EDITed.

**NR** No RESUME: End of program reached in error-trapping mode.

**RW** RESUME without ERROR: A RESUME was encountered before ON ERROR GOTO was executed.

**UE** Unprintable Error: An attempt was made to generate an error using an ERROR statement with an invalid code.

**MO** Missing Operand: An operation was attempted without providing one of the required operands.

**FD** Bad File Data: Data input from an external source (i.e., tape) was not correct or was in improper sequence, etc.

**L3** DISK BASIC only: An attempt was made to use a statement, function or command which is available only when the TRS-80 Mini Disk is connected via the Expansion Interface.

# C/Control, Graphics, and ASCII Codes

## Control Codes: 1-31

Code	Function
0-7	None
8	Backspaces and erases current character
9	None
10-13	Carriage returns
14	Turns on cursor
15	Turns off cursor
16-22	None
23	Converts to 32 character mode
24	Backspace ← Cursor
25	Advance ← Cursor
26	Downward ↓ linefeed
27	Upward ↑ linefeed
28	Home, return cursor to display position(0,0)
29	Move cursor to beginning of line
30	Erases to the end of the line
31	Clear to the end of the frame

## ASCII Character Codes 32-128

Code	Character	Code	Character
32	space	76	L
33	!	77	M
34	"	78	N
35	#	79	O

# H/User Programs

## Space-SHIP Lander

This challenging program lets you simulate a landing sequence on any of four planetary bodies: Earth, Moon, Mars, and the asteroid Vesta. Before each 10-second "burn" interval, you are given the following information:

Elapsed Time (seconds)  
Altitude (kilometers)  
Velocity (kilometers/hour) –  
negative amount indicates motion  
away from planetary body)  
Remaining Fuel (kilograms)

Using this information, you select a "burn rate" (kilograms of fuel/second). For example, a 10 Kg/sec burn rate consumes 100 Kg during the 10-second mandatory burn interval. Burns must be in the range 0-100 Kg/sec (over 100 Kg/sec would cause the "G" force to become too great.)

### Hints:

- A negative velocity indicates you burned too much fuel and are moving away from the planetary body.
- Fuel burns may include fractional parts (e.g., 15.5 Kg/sec)
- As you consume fuel, the weight of the lander decreases. Therefore subsequent burns will be increasingly effective.
- Landing conditions are different for each planetary body because each has its own particular gravity: Earth = 980 cm/sec<sup>2</sup>; Moon = 162 cm/sec<sup>2</sup>; Mars = 372 cm/sec<sup>2</sup>; Vesta = 17.5 cm/sec<sup>2</sup>.
- The up arrow  $\uparrow$  appears as a left bracket [ in this printout.  
Remember to enter it as an up arrow (for exponentiation).

Good luck, Commander!

```
100 CLS

## Customer Information

This program allows you (or your customers) to store information in a file for future reference. It stores Name, Address and Phone Number; the file can be recalled, modified, etc., by specifying the desired action using the "Menu" (Table of Commands).

This would be a handy way to create a mailing/phone list.

```

## Target Practice

This program uses the INKEY\$ function to simulate one of the popular "video games". Notice how few lines are required. This program could easily be "dressed up" — let the user choose a Fast Target, Slow Target; keep score, print special messages, etc. To change the speed of the target, change line 40 as follows: instead of "RND(10)/10", use "RND(0)\*S1". For a slow-moving target, let S1 be small (less than 1); for a faster target, let S1 be greater than 1. S1 should not exceed 1.5 or the target will advance to the next line.

```

### Ready-Aim-Fire (Bouncing Dot Revisited)

Remember the LEVEL 1 Bouncing Dot program? This program takes that idea and turns it into a game for one or more players by means of the INKEY\$ function. The object is to enter the correct 3-digit combination that will cause your missile to destroy the bouncing dot. (The 3-digit number corresponds to the X-axis of the display and therefore should be in the range 001 to 126 – and be sure to enter leading zeros for 1- or 2-digit numbers.)

The Computer always takes the first shot; then it's Player Number 1's turn.

```

## Things You Should Know — LEVEL II TRS-80

1. After executing an INPUT #*n* (input from cassette), some TRS-80's will not READ properly from DATA statements. Instead a RESTORE will automatically be performed before each READ, so that only first DATA item will be read.  
If your TRS-80 operates this way (depends on a few IC's from one supplier), there is a simple fix. Insert the statement,  
**POKE 16553,255**  
immediately after every INPUT #*n* statement.
2. A PRINT #*n* statement can put no more than 248 bytes on the tape. If you have a lengthy PRINT# list, only the first 248 bytes will be saved on tape; the rest will be lost. Therefore you should break up such lists into two or more PRINT# statements.
3. If you have an Expansion Interface connected and you need to Reset the Computer, hold down the BREAK key and press Reset. This will return you to the MEMORY SIZE question. Any BASIC program in memory will be lost by this Reset sequence.
4. If you stop a BASIC program during execution, and then alter the program itself, all variables will be reset to zero. You will not be able to continue execution where you left off. RUN it again. Note: If a syntax error is encountered and BASIC puts you in the Edit mode, type Q to return to the Command mode. You can then examine variable values, if you wish, before fixing the syntax error.
5. If you attempt to execute an LPRINT or an LLIST when a line printer is not connected (or is turned off), the computer will "freeze up". Either turn on the line printer, or, if one is not connected, Reset the Computer (see 3 above).
6. All the built-in mathematical functions in LEVEL II BASIC return single-precision results (6-7 digits of accuracy). Trig functions use or return radians, not degrees. A radian-degree conversion is given in the LEVEL II Reference Manual.

**7. Hard-to-find program errors:**

Shift characters are not always interchangeable with their unshifted counterparts. For example, PRINT@ will not work if you use a shifted @, even though it will look ok on the screen. If you can't find anything wrong with a line which causes a syntax error message, try retyping the line, watching out for the shift key.

Spaces are sometimes important in LEVEL II BASIC. The following line is incorrect:

IFD<0D=0

because 0D is interpreted to mean "double-precision zero".

Change it to:

IFD<0 THEN D=0

**8. To use the CLOAD? with cassette #2, use this format:**

CLOAD#-2,?"filename"

**9. If you frequently get "double-entries" when pressing a particular key, remove the plastic key cap, and carefully clean the contacts, using a stiff piece of paper. Insert the paper between the contacts, press the key down to pinch the paper, and pull the paper out while the contacts are pinching it.**

**10. If you have other questions regarding operation of your TRS-80, call Customer Service, (817) 390-3583, or write:**

TRS-80 Customer Service

Radio Shack

P. O. Box 185

Fort Worth, TX 76102

**11. The maximum TAB for an LPRINT statement is 63. The Line Printer won't tab past column 63. There's a simple way around this limitation, using the STRINGS function to simulate tabs past column 63.**

Example:

LPRINT TAB(5)"NAME"TAB(30)"ADDRESS"STRINGS(63,32)"BALANCE"  
will print "NAME" at column 5, "ADDRESS" at column 30,  
and "BALANCE" at column 100.
